EXP-SSI-db46fa — run report

Run `RUN-SSI-989893` · trial `orbit-deficit-p19` · 2026-11-01

Experiment. Toy Galois-orbit deficit census of membership j-invariants in F_{361} (`p = 19`, `F_19[z]/(z^2 - 2)`), hypothesis `H-SSI-bff8d9`. Frozen plan `experiments/EXP-SSI-db46fa/trial-plan.json`, sha256 `287aa0c3…6e90a`.

What ran. One trial, one process, the plan's argv verbatim: the driver wrote `manifest.yaml` and `raw-result.json`, then the independent checker ran on the run directory. Wall clock 10.54 s; driver and checker both exited 0; the supervisor recorded `status: output_validated`.

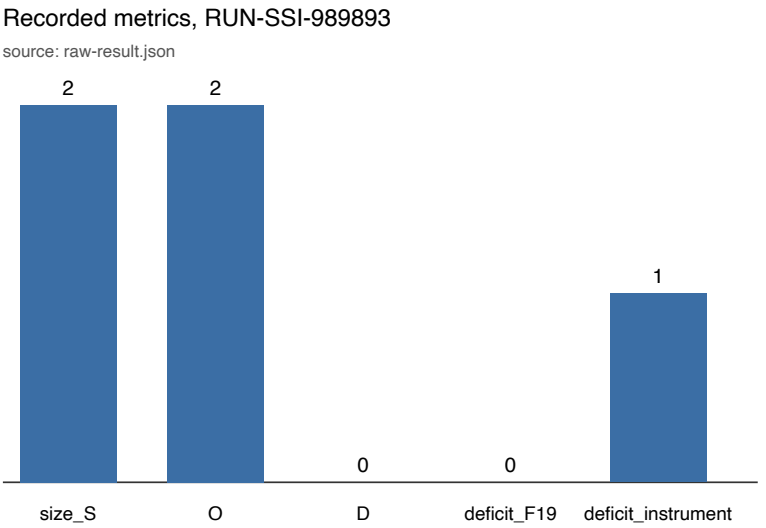

Figure 1: Recorded metric values from `raw-result.json`. The bars are the recorded numbers, not a comparison or a test.

Metric	Recorded value
`size_S`	2
`O`	2
`D`	0
`deficit_F19`	0
`deficit_instrument`	1

Controls reported by the driver. `deficit_F19 = 0` on the same-shape null; `frobenius_sends_z_to_minus_z = true`; `z_squared_is_2 = true`; `roundtrip_ok = true`; `routes_agree = true`; `duplicate_ok = true`; `twist_only_memberships = 0`; `roundtrip_failures = []`.

Custody. All nine declared artifacts and their SHA-256 values are in `execution-receipt.json`; the release binds ten artifact hashes. The plan, specification and source files were committed before launch (`b78f54c1e7`); the run directory is committed after.

Scope. This report states what ran and what the run recorded. It contains no verdict, no support or weakening, and no significance claim; those belong to `/review-evidence`.
