Production runner: scoped readiness composition

DEC-20261030-ffb927 · 4 November 2026
GOAL-ECDLP-e70832 · EXP-ECDLP-787704 · BATCH-d9a94d
Composition TASK-20261030-3621f5, epoch 2

The fixed fixture executes two real processes and all eight producer test groups passed. Independent review identifies three concrete production-integrity blockers. The Coordinator decision is **revise**: carry these working components forward into a narrow additive runner repair. Evidence strength is preliminary, with toy controls and static source analysis; the decision concerns software readiness.

Observation

TASK-20261030-e6c474 observed 16 setups, 16 singles, 20 intents, 20 traces and 24 cells on the disclosed F11/F23 fixed input. Both BSGS answers were 7. All eight producer groups replayed successfully. Five mathematical source hashes still match the frozen statement. This composition executes no fixture or scientific workload.

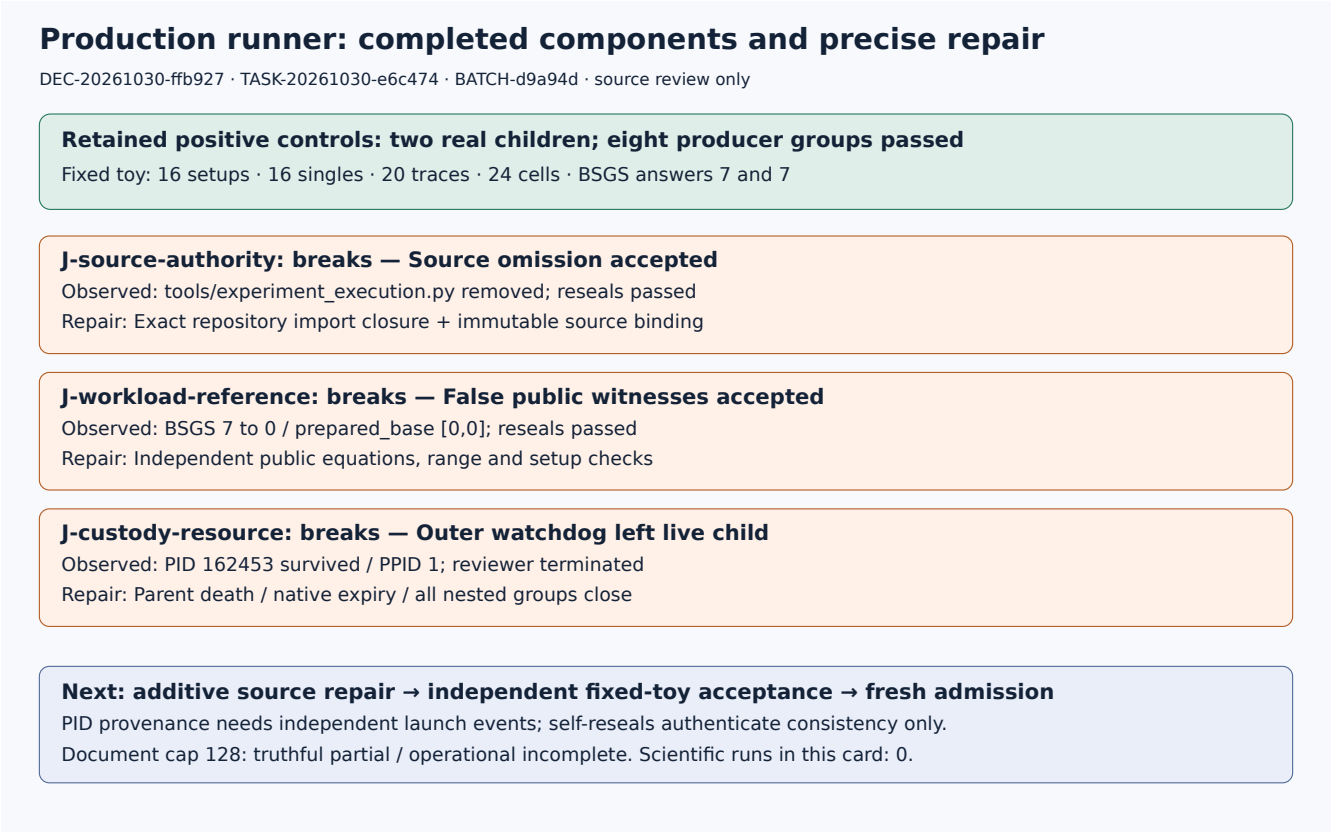

Diagram: retained same-path controls and outer native watchdog observation, not new trials. Source: TASK-20261030-e6c474 report.md, source-review.json and checks.json. The three joints each have exactly one independent reviewer.

Comparison

J-source-authority — breaks. Omitting tools/experiment_execution.py from both process source captures, then resealing all dependent bytes, still passed. Require exact source-set equality reconstructed independently from the real repository import closure and immutable publication/native archive bindings.

J-workload-reference — breaks. BSGS scalar 7→0 with its true verification flag, and prepared_base→[0,0] with resealed bytes, still passed. Recompute scalar range, public equations, curve/base/target membership and required setup values independently from bound public inputs.

J-custody-resource — breaks. An outer native watchdog killed the helper yet the new-session candidate survived: PID 162453, PPID 1. The reviewer terminated that child; later zombie state is recorded without an adopted waitpid acknowledgment. Parent death, native expiry and outer watchdog need complete nested process closure.

Repair action and evidence boundaries

Inference

Freeze one additive source-repair packet around the retained counterexamples. Preserve all five mathematical pins, original/v2/v3/v4 history, original sampling law and every negative or partial record. Independently establish the exact repository import closure, including native transitive imports. Use an independently preserved supervisor/root launch event to bind PID/start/parent/argv/input/source identity to an immutable archive. Consistent self-reported PIDs and reseals cannot authenticate a past process.

Exercise deterministic toy parent death, nonzero exit, TERM refusal/escalation, native expiry and outer watchdog. Retain explicit closure acknowledgments, source before/after, raw streams and all partial framing failures. Document cap 128 yielded a truthful operationally incomplete record; this alone is not a checker defect. Do not silently retry, discard records or replace missing observations with zero.

After source archive and independent technical acceptance, complete a separately frozen runnable admission for **three separate fresh 48-curve cohorts**. Preserve the union of 218 earlier exclusions, 48 current curves and every earlier new-batch identity; retain circuit2.a1, all six cells and paired original/incremental traces. Actual preapproval, approval/archive, ready selection and current checkpoint precede each draw. This composition implements no repair and opens no successor task.

Static workload and resource limits

The unchanged original schedule gives 216 setups, 345,600 singles, 36,864 traces/intents and 73,728 cells. These are derived finite counts, not completed production execution. The 1,800 singles and 128 calibration-trace rates come from the pinned original cohort.plan, as the statement omits those rates; this is not a statement-only blinded derivation.

493,272 row slots × 67,108,864 bytes gives a **conditional** 33,102,923,563,008-byte format ceiling. The reader ceiling is not proved to bound every emitted row. The configured default physical hard sum excluding observed pipe capacity is 8,611,168,256 bytes. Neither establishes machine fit. Per-process address-space limits are not aggregate RSS; polling is not a filesystem quota. Include generation, source, logs, partials, native supervision, archive and readback copies; assume no compression ratio.

Limitation and provenance

The production-positive route remains unexecuted. Scientific runs, new entropy draws and VMs are all zero. Full-cost/counter, clock and RSS qualification remain separate from descriptive solver outcomes. Keep Goal active and H-ECDLP-6674c9 specified. No knowledge promotion is proposed.

The historical EV-ECDLP-78ed38 same-ID schema correction grades **C-completeness: isolated** and **C-reference: not_isolated**; its seven original export findings remain distinct and unresolved. The fixed-fixture **typed-contract** comparison is not_isolated after the retained source/public/custody breaks.

Root verified full GET, all seven files and both review-PDF pages. Native independence passed on October 30 and again on current merged inputs. Current captured composition inputs are unchanged; the historical 93-path comparison belongs to its October 30 snapshot. Some native/docs/registry files changed after main merged. Root current hygiene passed; full ledger reports four unrelated errors, named in observations.json. Canonical scientific graphs were checked and left unchanged because this software-readiness decision changes no scientific quantity or relationship.

Editable Typst, graph generator, full captured sources/commands/events, exact hashes and all failures are embedded in composition/observations.json. Requested policy: coordinator-orchestration-code/high; serving model unverified/null. Final archive TASK-20261030-f1dfba is prospective and root-only. PR2590 must remain open, unmerged, with auto-merge disabled.
