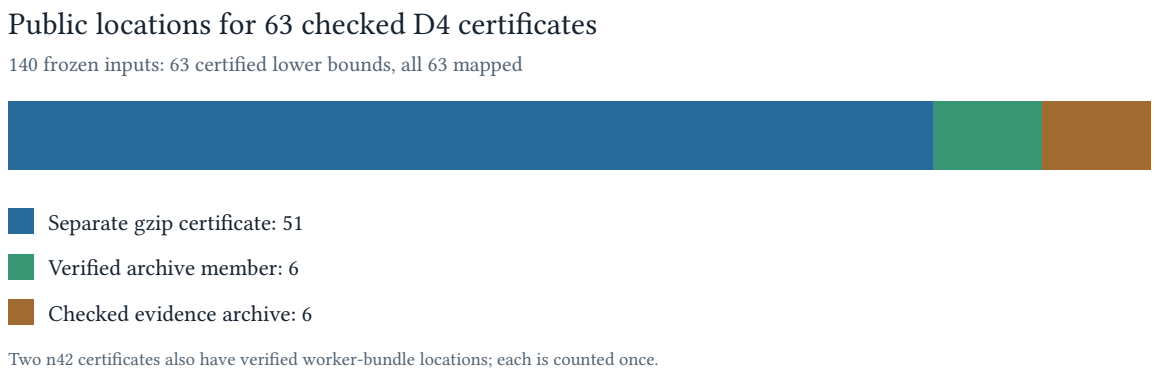
Public certificate coverage for the completed D4 panel

The final n=33–45 panel audit records 63 checked LFD-at-least-five certificates among 140 frozen inputs. The publication audit maps all 63 to checked public locations: 51 separate gzip certificates, six evidence archives with a verified certificate member, and six evidence archives with a previously checked certificate. Two n42 certificates also have verified locations in the original worker bundle and are counted once.



This audit checks retained archives, the worker bundle, result hashes, and committed publication receipts. It relies on the receipts' earlier anonymous HTTPS download checks and does not perform fresh downloads. The mathematical claims remain tied to the separate certificate checkers and exact counts in the panel records.
