Evidence review readiness: EXP-PFIVE-e26798

Reviewed 2026-11-07 against source commit 9fcec1b89bb8ffcdd1b8760db4da58db1022ce98. Scope: EXP-PFIVE-e26798 / RUN-PFIVE-e793f3, GOAL-PFDR-fd09e0, H-PFIVE-6510c2. This is an additive readiness report, not an EV/DEC record or a scientific adjudication.

Observation

The retained producer report records output_validated and producer/checker return codes 0. It reports 78 algebra fixtures, 390 matrix arms and 106 point cells. Those counts are quoted from the producer and were not recomputed here. The interrupted predecessor RUN-PFIVE-c8c614 remains a separate attempt.

This session verified that the export passes the current schema/protocol check with zero findings, without --verify-files. Its relative protocol path is valid; no replacement export was created. The execution receipt SHA-256 matches the existing snapshot receipt: 069e0d68f024a2dc3b535b96d6307a480e20abda28035e80b2970addd0b776cf. The snapshot receipt explicitly records native_snapshot_completed: false. Current GitRepositoryVerifier._stored_path still checks direct and legacy stored forms, without resolving .artifacts.json. Input hashes and exact checker output accompany this report in inputs.json and export-schema.txt.

Comparison

Task lifecycle section 7a requires verified native snapshot custody before dependent scientific review. The retained transport/readback receipt documents storage retention, but explicitly does not satisfy that requirement. The review-evidence skill stops for incomplete evidence sets. The custody diagram shows these recorded states, not measured scientific performance.

Inference

Dependent scientific review cannot proceed from this snapshot. No evidence strength, claim tier, scientific decision, hypothesis transition or knowledge promotion is assigned. This operational finding says nothing about the truth of the experiment's mathematical claims. Existing producer/checker outputs remain intact.

Limitation

No S3 objects were fetched, producer/checker computation replayed, raw-file coverage verified, or independent claim-changing review dispatched. The export check is structural only. No graph of scientific quantities was reconstructed from unverified raw files. The existing canonical scientific graphs were left unchanged because this readiness check establishes no new scientific finding. Whole-ledger validation refused

this sparse checkout; it was not bypassed.

Next action and exit criteria

The Coordinator should assign the existing problem's finite software integrity fixture: add manifest-aware native archive resolution pinned to the declared commit, with wrong-hash, missing-entry, ambiguity, path-traversal and legacy regressions. Then reconcile a fresh native archival receipt against unchanged run bytes and hashes. Only a verified archive can release a committed review plan and independent scientific review. A failed fixture keeps this exact gap open. No new scientific producer run is needed to establish custody compatibility.

Problem: problems/native-snapshot-artifact-manifest-resolution.md. Existing run report: experiments/EXP-PFIVE-e26798/reports/run-20261029T0454Z/report.md. Snapshot: coordination/prime_sat_five_tests_20261029/sat_point_followup/run-snapshot-receipt.json.

Sources checked

All sources are internal, retrieved from the pinned repository revision: AGENTS.md; docs/agent-contract-extended.md (literature-first and observation rules); docs/task-lifecycle.md section 7a; docs/claims-and-verification.md; .claude/skills/review-evidence/SKILL.md; the existing problem, protocol, export, producer report and transport snapshot; tools/research_dispatch.py. The report's cited mathematics was not re-reviewed because the custody gate stopped this pass before interpretation. No novelty or mathematical conclusion is asserted. The existing problem supplies the relevant prior engineering analysis and acceptance criteria, which this pass rechecked at current source.
