Cloud source qualification: scheduling deadline

The source job was submitted at 18:58:52 UTC on 2026-10-30. Kubernetes recorded DeadlineExceeded and a Failed condition at 19:58:53 UTC. Every observed pre-terminal pod state was Pending/Unschedulable. The post-terminal status has no pods; the bounded log query and recursive listing of the exact S3 job prefix returned no output.

The frozen cloud protocol remains unfulfilled. Its six source cases have no accepted results, and no dependent restore pod was launched. No successful trial rows or experiment export are fabricated. Existing native and local-worker controls do not establish cloud qualification. This operational failure proves no LFD bound.

Evidence is retained in runs/blocked-worker-cloud-source-terminal-001.json, runs/blocked-worker-cloud-source-output-check-001.json, and the earlier pending status. Protocol SHA256: 691181aa857920db5e544da5838a9163e811e18ad5a56ae2d704a73c0a283efe.

Next: reconcile capacity after the priority frontier job ends. Any retry requires a new identity and prospective execution record, preserving placement guards and resource caps. Forty original high-memory inputs and nine panel inputs remain unfinished. The separate n47 and n45 producers were not changed. No mathematical evidence-graph edge changes.

Source job ⟶ observed Pending / Unschedulable

3600-second job deadline ⟶ DeadlineExceeded

No accepted cloud controls ⟶ restore not launched
