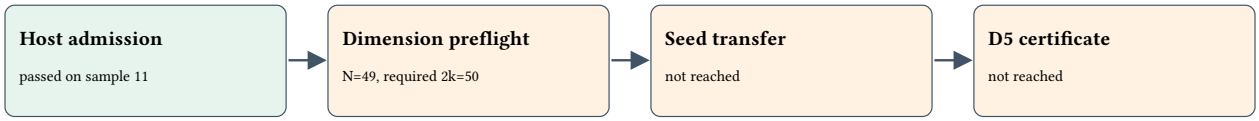
n49 poly00 v1 local preflight refusal

Host admission passed on sample 11 after 110.266 seconds, with 37,462,147,072 available bytes. The worker then refused the request because `disk_policy.N=49` was the curve parameter, while the published seed has **50 Boolean variables** (`2k`, with `k=25`). No seed transfer, checker, exact count or D5 producer ran.

n49 poly00 v1: preflight refusal before data

One attempted launcher; exact counter and algebraic stages did not run



Source: runs/n49-poly00-d5-local-preflight-refusal-001/manifest.json

The raw refusal record is `runs/n49-poly00-d5-local-preflight-refusal-001/manifest.json`. The frozen v1 protocol remains unchanged. A separate v2 request corrects `N=50`, uses a fresh output root, and adds pre-admission dimension checks. This operational refusal gives no LFD conclusion.
