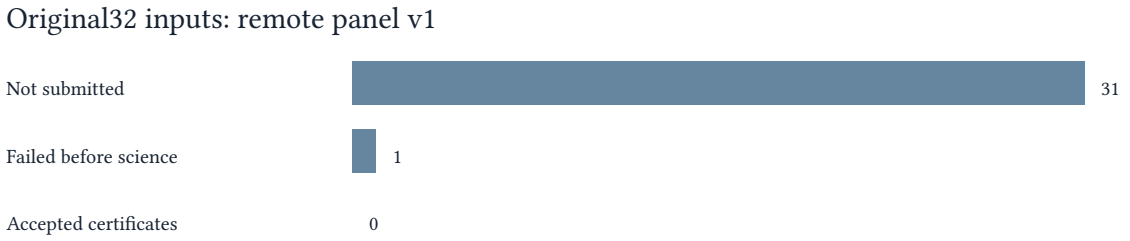
Remote panel v1 pilot



The first of32 fixed original n42–45 requests was submitted once with48GiB. The pod ran and verified all input archive hashes, then the wrapper rejected a2=1 before controls/count/checker. No mathematical result or S3 result bundle was produced. Remaining31 requests were not submitted under v1.

This is an implementation failure, not a negative LFD result. The original v1 source, protocol and failed job are retained. Correction and prospective v2 protocol use the same original input identities. Source diagnosis and five new controls are in ../../validation/PANEL-WORKER-V2.md.

Protocol: ../../panel-protocol.json. Raw failure: failure.json. No complete experiment export is emitted while the32-input scope remains incomplete. No canonical mathematical graph changes: this pilot produced no bound.

Job UID: c1f3b890-b797-4597-a6dc-a851e890a718.
