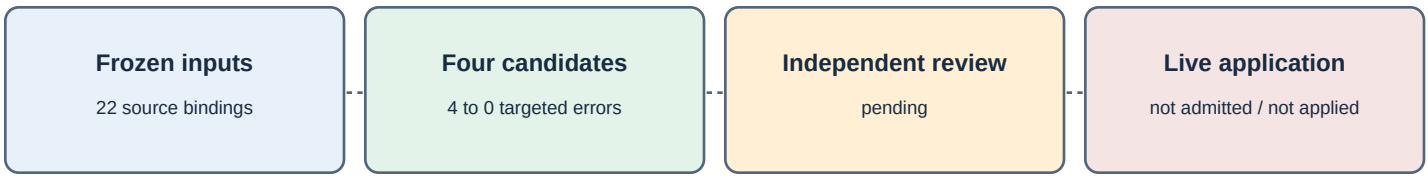
# BINSTD attribution correction candidates

2026-10-29 | T-782 | TASK-20261029-8b1359 | APPLICATION PENDING



## Source and reading scope

Source: 7e45528b293fd42049b1486a03135670ab5ac55c. The packet hash-binds 22 documents. The coordinator read six KR cards and four effective proposal claim/prior-art/citation blocks. This is a repository-card comparison; it is not new full-text literature verification. The factor-base V card is heuristic and its citations are abstract_read.

## Four proposed attribution changes

IDEA-20261003-43f871 and -4f41d0: preserve internal idea comparisons verbatim under internal_lineage. The latter also receives a truthful SAT/XOR-card comparator. IDEA-20261003-94078e and -c9c6c3: add explicitly retrospective comparisons, dated October 29, retaining scoped and inconclusive package boundaries.

## Preservation and checks

Every parsed field outside prior_art equals its effective source. Original and prior replacement bytes are unchanged. The real pinned prior-art validator gives four errors before and zero for these four candidates. Twelve negative controls pass: claim mutation, invalid typed IDEA reference and absent prior_art, for each candidate.

## Limitations and retained failures

This is a targeted function check, not full-ledger validation or live routing. The global error count has not changed. V1 candidates are retained; V2 repairs the misleading SAT/XOR comparator. An initial sparse-dependency failure was retained and corrected before the successful check.

## Independent review and application

Review TASK-20261029-d6606a remains pending. Conductor refused ledger/registry admission because of T-650/T-673 migration reservations; only the report directory was admitted. Before application: acquire the proper scopes, verify current source hashes, validate all routes, compare full-corpus errors, and pass independent review and current-head CI.

## Scientific and visual boundary

No seed, threshold, approval, claim, novelty status, result or experiment contract changes. No new theorem, experiment or attack-cost claim is established. The diagram is a procedure outline; no canonical performance graph is changed. Full details and exact hashes are in REPORT.md, sources.json and candidate-checks-v2.json.
