Historical claim evidence register

Initial partial seed | 2026-10-29 | Conductor T-777

Identity is checked. Scientific content and complete coverage are not established.

Observation

The integrity reader bound 6 selected rows to 15 available Git blobs (432,829 bytes). One elaborated-types record is unavailable. The total historical claim denominator is unknown.

Mathematical scope

Four known-label polynomial identities over arbitrary commutative rings are linked to their historical source, native job, axiom output and scoped reviews. This does not validate the newer integration head or prove graph, probability, cancellation or cost bridges.

Execution and interpretation

The BINSTD row links the archived deterministic reconstruction and witnesses; original timing and complete execution binding remain separate. The crypto row records the cover assessment's stated classification/implementation boundary without revalidating catalog counts.

Validation boundary

Eleven real-Git unit tests exercise integrity controls. Integrity success never promotes a scientific claim, even with every evidence role populated. The historical artifacts remain immutable. Hosted checks and independent code review are pending at initial publication.

Next work

Expand the claim inventory, bind missing elaborated types and execution/protocol inputs, obtain scoped independent reviews, then update affected canonical dashboards from accepted evidence. Full historical validation remains open.
