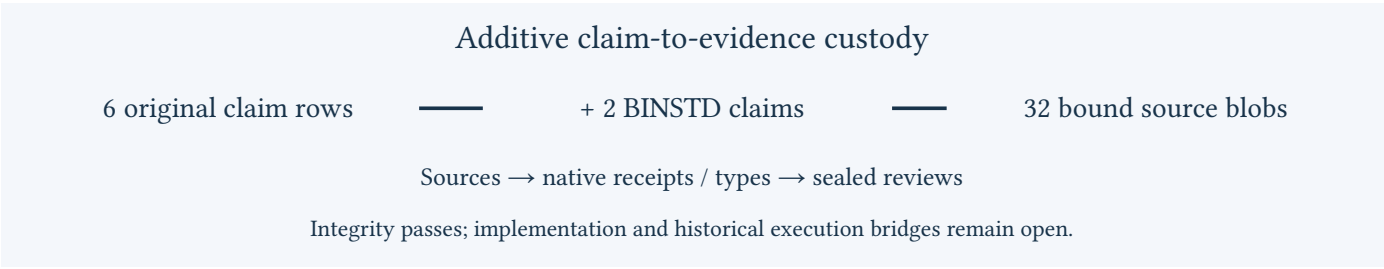
Historical claim register: BINSTD links

T-794 · 2026-10-29 · Additive custody revision



Added mathematical rows

Two already reviewed fixed declarations are now individually linked: irreducibility of the factors encoded by 313 and 471 over ZMod 2; and Frobenius order 17 and the factored minimal polynomial on canonical GaloisField 2 17. Each row binds original Lean bytes, printed native types, axiom audit, pinned dependencies and independent source, blind-math and type reviews.

Integrity observation

The unchanged reader passes 8 rows and 32 available Git blobs (602,399 bytes). All six original rows and their sources are preserved. One original known-label elaborated-type record remains unavailable. Register size is not scientific coverage; the individual-claim denominator is unknown.

Historical evidence retained

The two named native targets passed. Their supplemental overall run failed on another target, and its original control job failed during setup. Later successful control evidence is separately linked. The existing supplement's scoped mathematical conclusion is retained as evidence, not issued anew by this register.

Open bridges

The historical program still needs encoding, quotient-field, arithmetic, Frobenius conjugacy, matrix and constructor refinement. Original selected inputs, machine execution, full outputs and timing need separate evidence. No yield, speed or security conclusion follows from role completeness.

Delivery gates

New mapping review and final-head CI remain pending. No native build, experiment or new capacity was used. Historical plots and dashboard performance values do not change.
