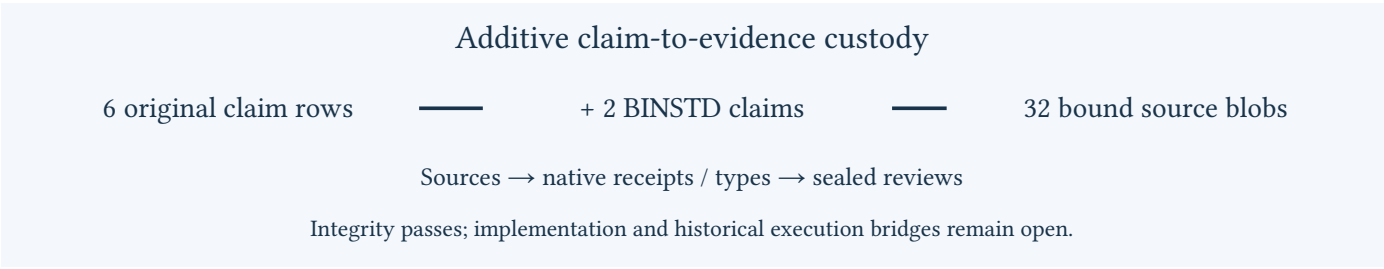
Historical register: independent review

T-794 · 2026-10-29 · Additive mapping and scope preservation



Scoped conclusion

The independent reviewer holds for the two new BINSTD claim-to-evidence mappings at d316dffae04f9b50131c31d50a005cf7daca1061. No blocking mapping defect was found. The original matrix and initial-publication report remain unchanged; this is a separately dated addendum.

Independently checked

All six original claims and 16 original source records are unchanged. All 32 available blobs, 602,399 bytes, and eight excerpts match. The entire integrity result reproduces. New statements match exact fixed Lean declarations, receipt identities, native printed types and sealed review scope. All six reviewer artifact hashes pass archival verification.

Controls and failures preserved

Altered excerpts, hashes and a false complete-coverage flag are rejected. Byte integrity alone accepts swapped evidence roles or unjustified prose; the independent mapping and scope check rejects them. An initial Git timeout is retained alongside the unchanged successful retry. Failed overall native execution and originally skipped controls remain explicit.

Remaining obligations

This is no new mathematical or scientific verdict. It does not prove the historical program, selected inputs, complete outputs or timing. Encoding, arithmetic, Frobenius/matrix/constructor bridges and complete claim coverage remain open. Native runtime and dependency trust remain explicit. Final-head hosted checks and guarded merge are still required.
