TASK-20261027-3a4831 - fixed-x native source engineering

Latest retained invocation: exit 0; passed 60; failed 0.

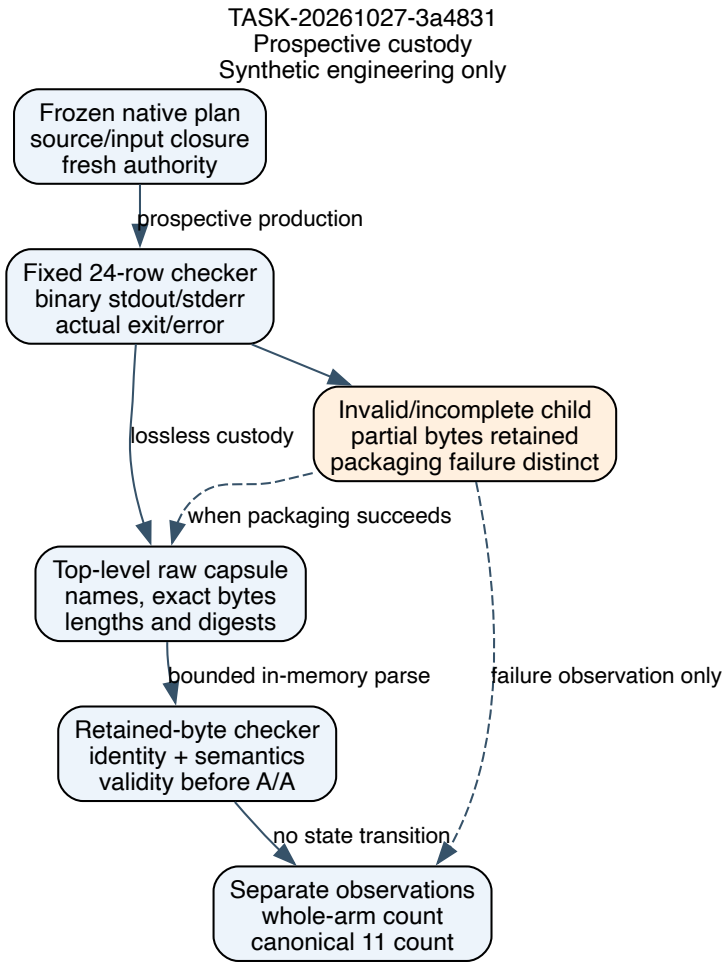
Synthetic p101 engineering only. Latest guard totals:
{"child_calls": 63, "fake_cli_processes": 1, "forbidden_process": 0, "legacy": 0, "named_membership": 0, "scientific_runs": 0, "storage": 0, "synthetic_predicates": 3286, "vm": 0}

Preserved scientific scope: 21 identities, 24 representation rows (11 canonical omissions, 10 self controls, 3 sign sensitivities), and four correlated batch rows. The broader 69-position limitation remains. Whole-arm counts and the canonical 11 subset count are distinct.

Custody: frozen native authority -> fixed checker -> binary captures and bounded lossless capsule -> local identity/semantic checks -> individual validity before A/A. Packaging success does not establish validity.

Failures and all raw attempts are retained in test-receipts.json. Latest failing checks: see retained suite; no failure is suppressed.

Remaining: producer assessment, pushed snapshot, independent engineering invocation review, successor scientific protocol, actual preapproval/approval/ready and lawful scientific claim. No official transition. Full goal criteria unchanged.

Sources: immutable BATCH-05b760 exhibits, source-inputs.json, native supervisor source; Python subprocess/gzip/json docs. External documentation was retrieved during authorship. Full source hashes and test seams: IMPLEMENTATION_REPORT.md.


Engineering-only retained invocation history: sequence 1: 55 pass/0 fail; sequence 2: 55 pass/5 fail (3 accepted invalid synthetic packages; 2 later-gate mismatches); sequence 3: 60 pass/0 fail. Latest raw extra/missing/type and unsupported outer historical-selector/official-transition controls: 5/5 PASS at their intended gates.
