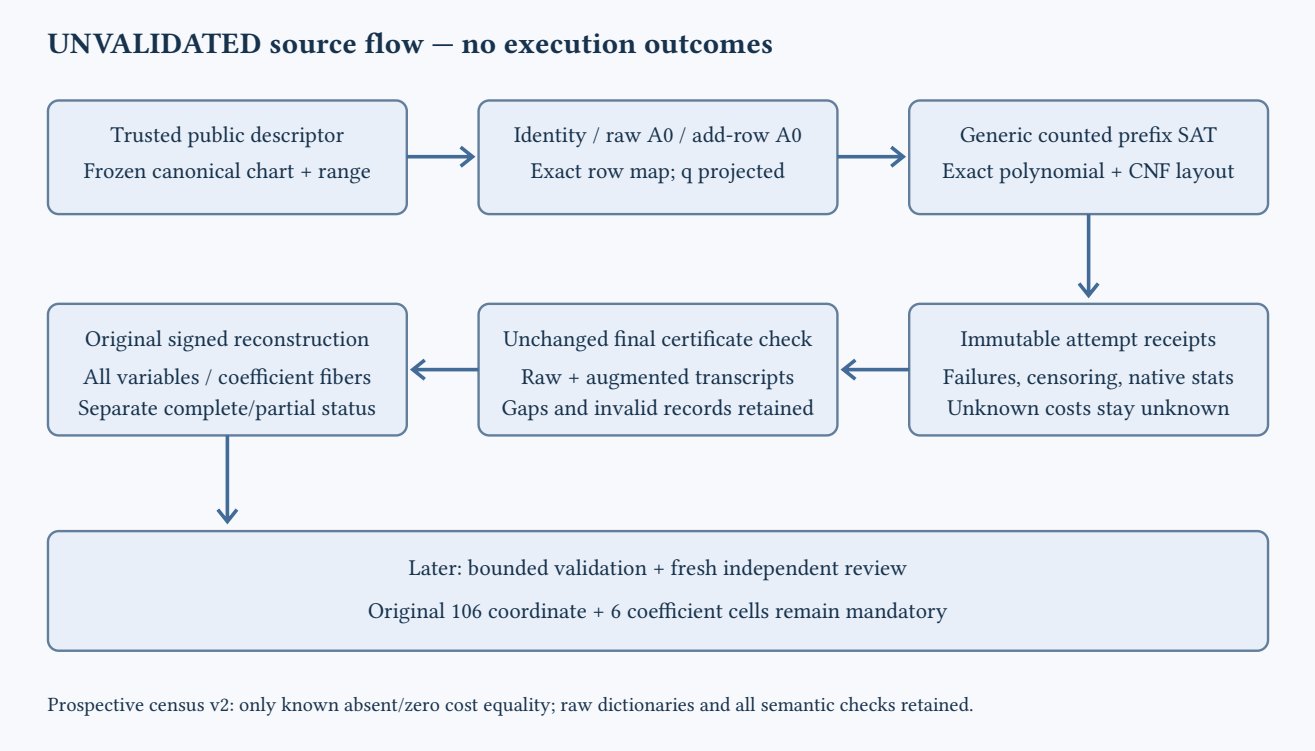
Transform integration source

UNVALIDATED — TASK-20261105-07e2d4

Eight additive modules author descriptor-rooted transformation, complete-chart certified SAT, attempted-work receipts and a prospective census-counter adapter. No candidate imports, compilation, tests, native calls, census, CAS, builds or installs occurred. No pass counts or measured outcomes are reported. [pcc:unverified]



The k2 transform binds the exact original descriptor and canonical rows. Added-row mode appends N1+2aN2 before substituting A0=b−a*q; raw mode omits the append. All nonzero rows and duplicates remain, literal zero omissions have row maps, and q remains projected. Returned assignments are reconstructed through the original range and signed checks. [pcc:unverified]

The generic bridge uses exact n, p, projected bits, polynomials and domain CNF. The counted engine records arithmetic deltas in finally and available native statistics before teardown. Primary errors, secondary cleanup failures, raw and augmented transcripts, gaps and immutable checkpoints remain distinct. A valid partial transcript is not certified completion. [pcc:unverified]

Census v2 only equates known omitted and explicit-zero counters. Exact construction costs and original model, projection, budget, certificate and witness predicates remain intact. Raw counts are retained. Full fixed regressions, transformation/mutation/failure controls and the twelve prescribed native smoke instances are source for later admission; they have not run. [pcc:unverified]

Limits and next step. Importability and behavior are untested. Interrupted counters hidden inside unchanged baseline routines remain unknown. The launcher must enforce one CPU/2GiB and the separate two-producer/one-reviewer attempt budget. Actual runtime identity is unverified under the prospective amendment. Root source publication precedes bounded validation and fresh independent review. The original106 coordinate plus separate6 coefficient comparisons and all five leads remain required. [pcc:unverified]

Provenance. Published software contract, validation plan, counter readback and retained comparison scope; frozen original composition/compiler/engine/encoding; sealed independent k2 derivation and DEC-20261102-592897. That derivation cites Caminata–Gorla arXiv:2112.05579v2 for definitions. Exact hashes and fork scope appear in source-provenance.json. No new theorem or literature-novelty claim is made. [pcc:unverified]
