n51 polynomial-01 D5 stream: terminal attempt

The single frozen Job `semaev-n51-poly01-d5-stream-20261101-r1` failed at 21:09:31 UTC on 2026-11-01 with Kubernetes reason `BackoffLimitExceeded`. The pod is no longer retained and the bounded log API returns no text; the underlying cause is unknown.

The original D4 checker accepted codimension at least 45,615, and fresh exact counting found zero solutions. All nine retained early-stage objects matched their saved byte lengths and SHA-256 hashes. The D5 candidate multipart upload had zero completed parts at terminal reconciliation. No completed D5 object, checker transcript, or final result was retained. This attempt supplies no D5 closure or degree-six lower-bound claim.

The frozen protocol allowed one named attempt and no automatic retry. A successor needs a new frozen request and a checkpoint-capable or direct dual-witness construction. The detailed evidence and source-bound proof obligation are in `terminal-report.md` and `proof-bridge.md` in the same directory.
