## Next-input dimensions: n47 random02

Observations only. The retained seed digest, monomial order, unit representatives and triangularity passed structural checks. Both independent enumeration directions give 126,387 border coordinates and 187,583 total working coordinates.

n47 random02: two independent coordinate enumerations

| | |
|---|---|
| Full monomial enumeration | 187,583 coordinates |
| Extend free monomials | 187,583 coordinates |

Calculated allocation envelope: 92,117,754,292 bytes

Read-only structure; no closure or new LFD bound

At chunk60000 the bounded-export source formula gives payload 68,185,663,280 bytes. Its135/100 margin plus64MiB gives 92,117,754,292 bytes, below the96GiB child limit. This is a calculated gate, not measured RSS, minimum memory or runtime admission. Runtime guards and independent final checking remain mandatory.

One retained input, two enumeration methods, no new random draw, retry or exclusion. The profile performs no closure and adds no LFD bound. Historical D4 acceptance and count4 remain in reports/highmem-rand02-recovery-001. A future D5 attempt must recheck the seed, freshly enumerate solutions and independently accept a codimension greater than that count.

Source commit: 171fd3e604415939dd6b051cb6fca51f13c7d4ef. Raw result, frozen protocol and hash-pinned profile source accompany this report. Mathematical-bound graphs are unchanged because this is resource preparation only.
