Hosted formal receipt audit

PR 2805 · CI test merge `232f4e7` · October 31, 2026

A fresh full Lake workspace build and the per-target machine/axiom gate completed on hosted run `41155781140`. The downloaded artifact contains 91 exact named target receipts. The reproducible audit reports zero issues.

Check	Matched
Target spec, Lean module, theorem name	91 / 91
Machine verified, build, axiom audit	91 / 91
Declared source blobs	32 / 32
Tracked workspace inputs	73 / 73
Generated root from 51 modules	1 / 1
Verifier input blobs	10 / 10

All 91 receipts mark semantic review `pending`. Independent reviews are separate records; the raw receipts do not inherit their verdicts. The target count is not a denominator for all scientific claims across the repositories.

Claim boundary. Kernel acceptance and input hash consistency do not authenticate historical execution or prove that the formal statement fully captures a source claim. The Semaev finite-model meaning review is archived separately, with a visible batch-independence protocol gap.

Reproduction. See `README.md`, `verify_receipts.py`, `audit.json`, and the 91 raw files under `receipts/`.
