Certified n51 polynomial-01 D4 bound

The original independent checker accepted all 52 multiplication conditions for the frozen n51 polynomial-01 input. It verified $1 \notin W_4(F)$ and $\operatorname{codim} W_4(F) \geq 45{,}615$; fresh exact enumeration found zero Boolean solutions. Therefore the last fall degree of this named presentation is at least five. The degree-four certificate has 1,680,493,280 bytes; its SHA-256 is recorded in `evidence/result.json`. The producer and checker recorded 3,191.971 and 1,282.693 seconds respectively on the shared host; these are L0 execution records.

Next-degree resource profile

The retained D4 certificate yields 103,877 working coordinates and 58,262 border coordinates for the bounded D5 representation. Its source-derived allocation envelope at chunk size 60,000 is 64,677,063,002 bytes. Polynomial-00 has 103,867 working coordinates and a 64,638,795,838-byte envelope. These are allocation calculations, not measured peak memory or D5 results.

The companion Markdown report links the raw result, checker output, profile, small-file manifest, and public archive acknowledgement.
