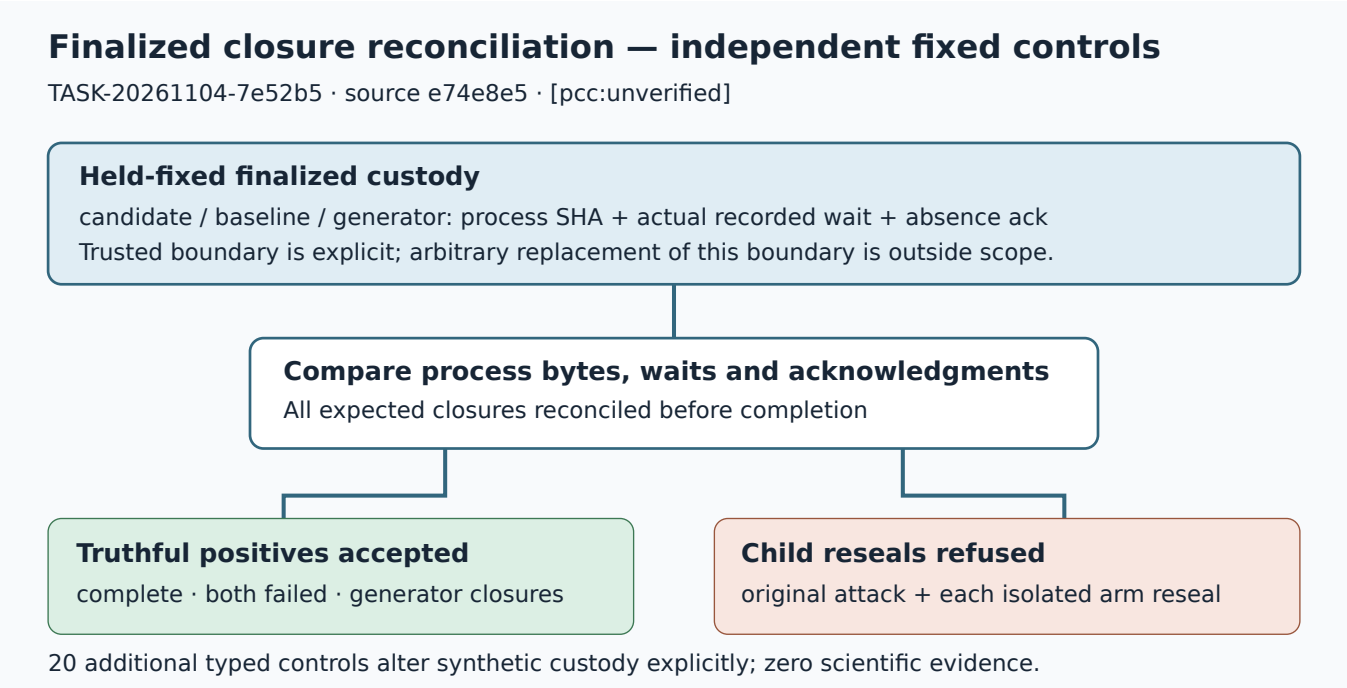
Independent finalized-closure review

TASK-20261104-7e52b5 · 4 November 2026

J-finalized-closure-reconciliation: holds at the fixed software boundary. All assertions are [pcc:unverified].

Three native fixtures and 54 static checks matched their expected outcomes under the new exact 59 source pins. No scientific run or cohort draw occurred.

Control	Fresh observation — [pcc:unverified]
P-complete	Native output_validated; static complete accepted.
P-incomplete	Both real solver exits 1; native infrastructure_error; truthful incomplete accepted.
P-generator	All 3 genuine closures; export 2 solver rows; fixed generator only.
Original reseal	Same-path waits 0 / false complete + genuine identical-public raw refused at finalized process SHA: baseline.
Per arm	Candidate, baseline and generator isolated reseals each refused at its own finalized SHA.
Typed structure	20 synthetic trusted-root alterations refused; strict int excludes bool/ string.



Exact positive bytes were restored at the same paths between mutations. Final complete, incomplete and fixed-generator positives passed. Original failed native receipt remains infrastructure_error. [pcc:unverified]

Source, budget and limits

Only observer.py and source-manifest.json change among 59 captured members. All 57 others and all 59 before/after suite pins match. The new checks reconcile current process SHA, exact true wait acknowledgments, strict integer returncodes, finalized/current equality and true post-wait absence before deriving completion. [pcc:unverified]

Single shared suite clock: 98.824771369 seconds. Start 2026-11-04T21:51:03.860615+00:00; finish 2026-11-04T21:52:42.685177+00:00. Prospective cap 180 seconds, at most 4 native calls; actual 3. Absolute deadline spans every helper, control, restoration and gap; no stop fired. [pcc:unverified]

Sampled descendant RSS 185,765,888 bytes; sampled new tree 148,670,199 bytes. These are sampled values, not exact peaks. Configured 4 GiB memory, 512 MiB raw,128 MiB capsule and 256 MiB reserve guards apply. The capsule inventory records final bytes. [pcc:unverified]

Prior producer deviation remains:198.681973 continuous seconds exceeds 180; 93.814976 execution sum does not cure gaps. Both prior helper failures remain archived. This independent result grants no waiver. [pcc:unverified]

Before the suite, a missing raw directory caused one shell redirection failure; the first preparation then hit FileExistsError. Both errors and the original helper remain retained. Controls ran once without restart. Initial orientation included truncated displays and read-only Git diff, with no Git mutation. [pcc:unverified]

Literature and provenance: archived TASK448845 and DEC d59957; current frozen plan/ statement/resources; retrieved Linux PDEATHSIG/subreaper descriptions and Python3.12 Popen.wait documentation. They distinguish signalling/adoption from actual wait receipts. No new network retrieval. Complete path/hash/read-scope inventory is in checks. [pcc:unverified]

Independence: fresh reviewer, not source author, no same-round sibling reports. External plan pin ff31ba05…146d6e5 matched before review. Actual native checker transcript against final attestation is retained. Serving model and signed PCC standing are unverified. [pcc:unverified]

Source e74e8e5; context eb355cd; archived R1 94179ef / directR2 5fa9970. Supplied archive/ checkpoint receipts were locally read, not independently re-fetched. [pcc:unverified]

Limits: held-fixed root custody against child reseals only. Synthetic typed controls deliberately change that boundary. No arbitrary-root authentication, hostile sameUID isolation, production generation-state propagation, unchanged 18 lifecycle replay, scientific evidence, performance claim or official readiness verdict. No canonical mathematical graph changes. [pcc:unverified]

Full report.md, source-review.json, final read-attestation.yaml, exact source/commands/logs/failures/ partials and editable visual sources accompany this PDF through checks.json. [pcc:unverified]
