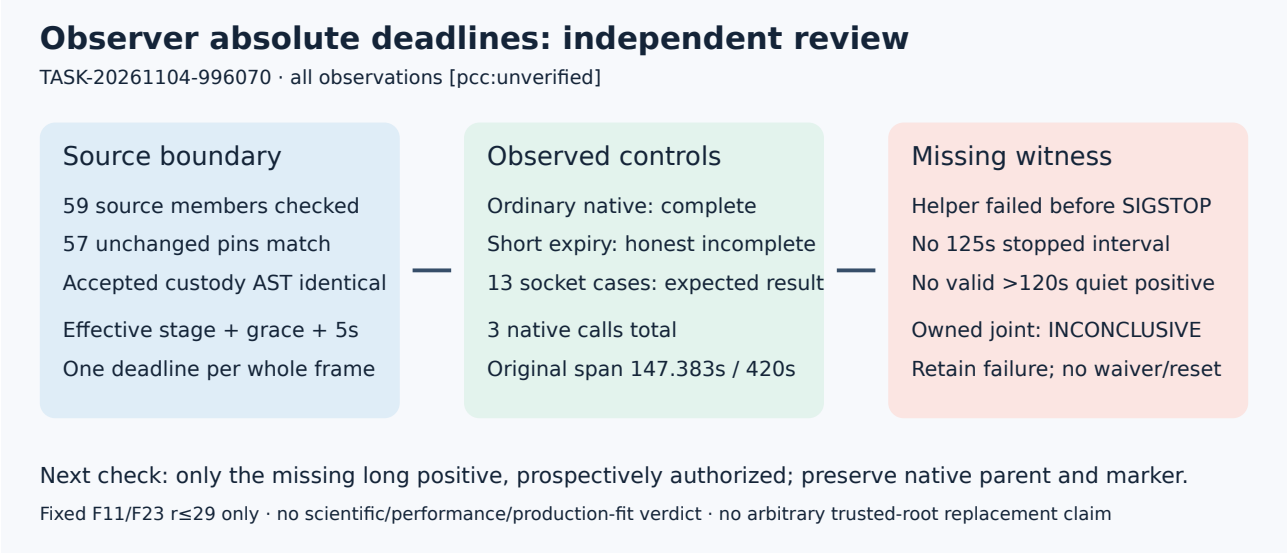
Independent observer deadline review

TASK-20261104-996070 · all empirical statements [pcc:unverified]

Owned joint: INCONCLUSIVE. Ordinary completion, honest short expiry and all 13 socket cases were observed. The required >120-second quiet positive with SIGSTOP >=125 seconds by itself was not obtained. [pcc:unverified]



Native observations

- Ordinary: output_validated; driver/check return 0; unchanged manifest; both actual child waits and finalized observer wait retained. [pcc:unverified]
- Short: candidate PID81209 watchdog at 2 seconds, return −15; baseline return 1. Native infrastructure_error preserved; same-path static checker while native parent remained alive returned operational incomplete. [pcc:unverified]
- Long: helper failed before STOP by equating post-exec baseline argv with pre-release lifecycle wrapper argv. Baseline later completed; actual baseline event-to-final gap61.343423 seconds. Native checker refused changed native record after helper exit reparented its supervisor. Actual driver/service waits retained; failed helper outer Popen.wait missing. [pcc:unverified]

Three native calls total; original shared control span147.382623 seconds of420, including setup/imports, failures and gaps. No deadline reset, fourth call, source/time mock or marker deletion. [pcc:unverified]

Actual socket controls and source law

All13 socket controls used actual sockets and the unmodified API. Benign split accepted; slow trickle, open peer, EOF, partial EOF, malformed, duplicate, nonfinite/overflow JSON, oversize receive/send and two blocked-send paths refused. [pcc:unverified]

Control	Total seconds	Actual outcome
Benign split	0.041	Accepted
Slow trickle	0.301	Timeout
Open peer	0.251	Timeout
EOF / partial EOF	<0.001	Closed refusal
Malformed / duplicate	0.001	Strict JSON refusal
Nonfinite / overflow	0.001	Nonfinite refusal
Oversize receive	1.414	Framing refusal
Blocked send / send+receive	0.251 each	Timeout
Oversize send	0.003	Framing refusal

All table values [pcc:unverified]. Slow-trickle total includes peer cleanup; API timeout0.25 seconds and per-byte delay0.06 seconds are configured values, not independently timestamped return latency. Eighteen effective-limit/invalid-timeout checks passed. [pcc:unverified]

A single finite monotonic deadline covers optional send and every receive plus final parse check. Effective allowance is validated DEFAULT_LIMITS merged with partial frozen limits, then seconds + terminate_grace + exactly5. Default127 seconds; declared long207. Ready/observe/closed/finish sends and client coordination stay finite5 seconds; strict1MiB frames remain. [pcc:unverified]

All59 source members match before/after. Other57 pins and accepted load_custody AST are unchanged. Only observer.py and manifest differ from the accepted prior capture. Source diff, raw process/source records and every helper version are retained losslessly in checks.json. [pcc:unverified]

Provenance, obstruction and limits

External plan SHA256: 078d090470cd4d410c08daff5f6bc5becebf1c513a9f256eb80b2926ecf80bfd

Actual source publication: af8a54211bcd6f0503c3d58d159289bff6a023ce

Source archive R1 a669e8fa9949c114e84c0b84df55f7a6665fd417 and direct R2 735492ce3ab48f8c8be313395d5191d78cb7a816, completed release, review claim and checkpoint were read locally. The earlier receipt queue differs from current later archive-state bytes; root’s immutable R1 queue was independently read/hash checked. No independent remote verification is claimed. [pcc:unverified]

Producer capsule268 logical files /731 hash chunks /69,841,870 logical bytes reconstructed and checked; producer outcome flags were not adopted. Prior producer198.681973 >180 seconds remains unwaived; historical reviewer98.824771369 seconds is separate. [pcc:unverified]

Literature first: archived custody review, frozen card and constraints, relevant driver/observer/lifecycle/native source, Python3.12 monotonic/sleep and Linux nanosleep primary sections. Sleep can count stopped time; marker does not prove sleep entry. Semantic read scope differs from all-input byte/hash inspection. [pcc:unverified]

Next technical check: only the missing long positive under a prospectively authorized handoff. Verify actual baseline PID/start and post-exec target, STOP>=125 seconds by itself, preserve marker, keep native parent alive through actual waits/final custody/static checker, and require observer gap>120 and complete native validation. [pcc:unverified]

Fixed disclosed F11/F23 r<=29, zero nonce; no science/draw/cohort/entropy/new EXP/IDEA/VM/cloud/benchmark. No scientific status, novelty, asymptotic, attack-cost, performance or production-fit verdict. Pinned root observer and held-fixed custody remain the trust boundary; no hostile-same-UID isolation or arbitrary root-history authentication. No comprehensive outside-write audit or measured aggregate memory-fit claim. [pcc:unverified]

The final adjacent read-attestation.yaml records actual reads and inconclusive joint verdict. Native independence transcript uses that final attestation and literal external plan pin; structural independence supplies no missing empirical witness. No PCC write/signature or mathematical graph change. All final PDF pages are actually viewed after final render. [pcc:unverified]
