Independent finite-law review

EXP-ECDLP-787704 / RUN-ECDLP-53b08d | TASK-20261030-cd89e7

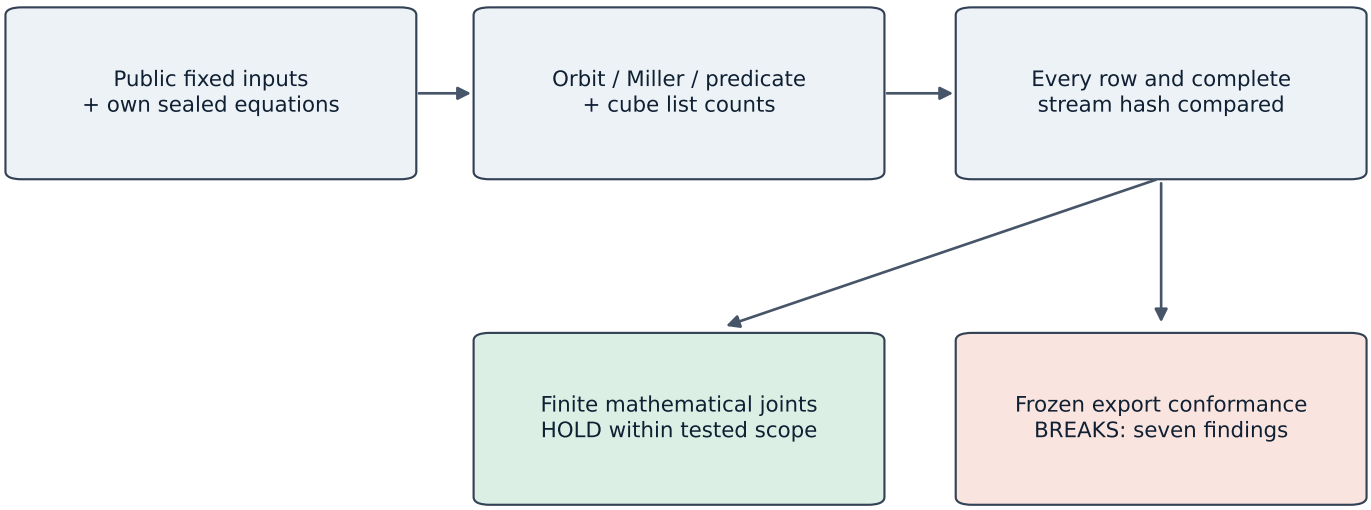
All new and retained mathematical records agree.

Frozen protocol/export conformance still fails seven checks.

Joint	Verdict	Observed scope
Predicate	holds	48 complete orbit/answer streams
Lists / reference	holds	4,929,828 scalar/cells + old words
Blinding	holds, conditional	Uniform nonzero permutation only
Integrity / export	breaks	7 frozen conformance findings

Complete scope

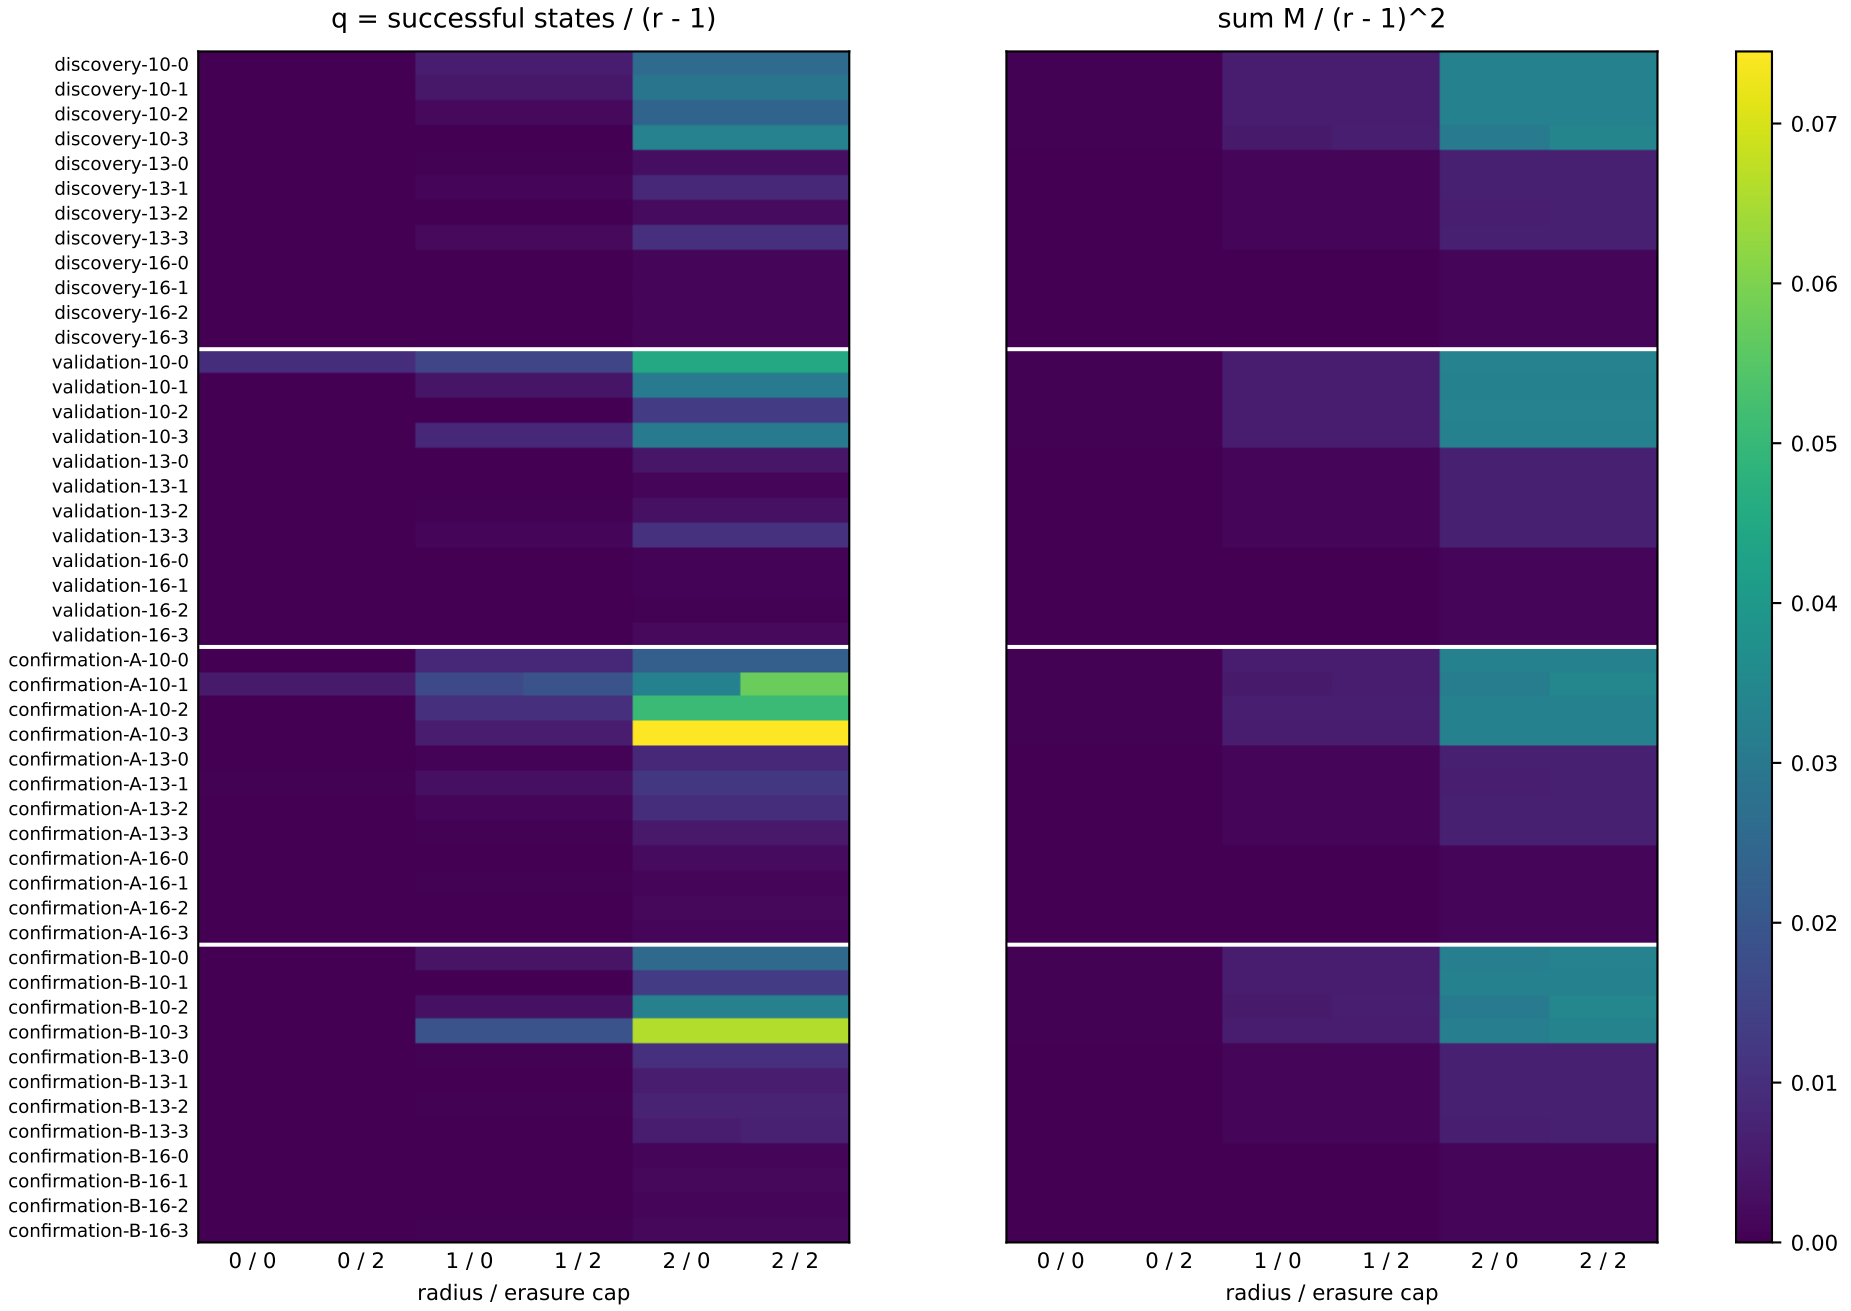
48 fixed curves; 821,638 nonzero states; six cells per state.
216 setups; 345,600 singles; 36,864 trace records;
73,728 retained cells; every 3,068,802 retained word.



No attack advantage, full-cost, family-transfer or official-status claim.
Exact source, commands, failed attempts and read custody: checks.json.

All 48 fixed functions and six cells

Independent exact recovery density and matched conditional-uniform reference



Both caps: q=0 on 41/48 curves at t0, 13/48 at t1, and 0/48 at t2. Colors are descriptive; exact fractions are in independent-summary.json.

Controls, custody and qualifications

Controls

32,256 exhaustive tiny cube/direct comparisons; genuine and negated half; erasures/caps/zero; interval, inverse, predicate and separate public-check mutations. Eighteen additional scoped integrity controls passed. Equivalent upper-bound and primary-anchor sensitivities are preserved explicitly.

Independent custody

Readiness seal: 2026-10-30 18:01:14 UTC, SHA 85a33360281a... . Committed root custody/read ACK: 4efe56b59fd2... . Sealed math remained unchanged through all comparisons. Producer source captures were decoded for SHA only, never used for mathematics.

Retained adapter history

Attempt 1 stopped on an unsupported per-setup singles assumption; attempt 2 on a bookkeeping-cost assumption. Both exact failures remain retained. Attempt 3 completed every required count and equation. Observed incremental metadata does not qualify physical native costs.

Frozen export findings

1. Actual instrument commit differs from pin.
2. Analytical reference arm has no execution row.
3. One measured row versus 96 typed protocol rows.
4. Candidate has one instance versus 48.
5. Reference has zero instances versus 48.
6. Arm instance identities differ.
7. Frozen analysis-script SHA link is absent/different.

Limits

The original native driver/checker0 and output_validated/published=false facts are preserved. The export checker independently returns1 with the same seven findings. Producer supervisor end-to-end mutation coverage, historical native/full attack costs, physical counter replay, per-process peak RSS, qualified clocks and actual PRG iid remain unqualified.

Interpretation

The result is complete agreement on the stated finite inputs and decoder cells, with a separate unresolved export contract. It is not a speedup, attack-cost, generic-curve transfer, novelty, exponent, hypothesis closure or official-status result.
