Independent production-route source review

TASK-20261030-e6c474 · BATCH-d9a94d · 30 October 2026

All three assigned joints break in this source-only review. The disclosed F11/F23 fixed-toy route completed in two real processes. Eight producer test groups replayed successfully. Independent controls exposed missing source-closure checks, unchecked public witnesses and nested watchdog escape. Scientific runs, new entropy and VMs: **0**.

Observations

85 pre-test pin checks passed, including five immutable mathematical files, full logical payloads, historical stored Git bytes and both exact mutable-index publications. Full delivery: 27,395,985 bytes. SHA256: `fcd46047290009980a941a17f027ca2cd1bb24ff5df609ac1622bba5057002e7`

93 declared-input/source files were byte-identical before and after. Independent fixed fixture: 16 setups, 16 singles, 20 intents, 20 traces, 24 cells. Native envelope controls refused approval, task, trial, input hash and environment-source contradictions.

Comparison and inference

J-source-authority — breaks: deleting one captured native source and consistently updating provenance/hashes still passed. Invented consistent PID 2147483646 also passed. A past PID requires independently preserved native/root launch events and immutable archive binding; resealing alone authenticates no historical process.

J-workload-reference — breaks: scalar 7 changed to 0 with a true public-equation flag, and prepared base changed to[0,0], still passed after dependent resealing. Static schedule counts match. The checker must reconstruct exact source-set equality and public equation/setup facts instead of trusting prior summary booleans.

J-custody-resource — breaks: native watchdog killed the fixed helper while its new-session candidate survived as PID 162453 / PPID 1 / PGID 162453. This reviewer terminated that exact hang child; ps then showed a zombie. Individual fault/watchdog/file/log controls retained partial bytes. Parent document cap 128 left a prefix and truthful operational incompleteness.

Scope, counts and retained limits

Derived counts

24 calibration curves and 24 confirmation curves give setups 24×8+24=216; singles 24×1800×8=345,600; calibration traces 24×128×8=24,576; confirmation traces 24×64×8=12,288; intents=traces = 36,864; cells 12,288×6=73,728. Total jobs 382,464; JSONL row slots 493,272. Eight calibration arms and three job kinds are present. The statement omits 1800/128 rates: those came explicitly from pinned original cohort.plan, so no statement-only blind derivation is claimed.

493,272×64MiB=33,102,923,563,008 bytes under the declared reader ceiling. The arithmetic is conditional: no source proof bounds every emitted row by that ceiling. Physical policy7F+25D+I+G+4(log+65536+pipe) has default base 8,611, 168,256 bytes excluding pipe capacity. Neither is a machine-fit guarantee. Tree/free-space polling is not a quota; RLIMIT_AS is per address space, not aggregate RSS. No compression ratio is assumed.

Limits and failures

The admitted production-positive branch was **unexecuted**. Five math pins remain unchanged; no new mathematical re-derivation, performance, exponent, novelty or global-negative conclusion follows. First orientation reads lacked persisted timestamps and had truncated output; full live byte capture began before imports/tests. Shell displays were not individually logged as semantic reads of every payload.

Nested-control attempts retained an import-path failure and a native 512MiB/child 2GiB preexec failure before correction. The observer missed the child; actual post-return ps supplies the orphan evidence. Cleanup terminated the real child before a later loop matched its own shell text and asserted. There is no claimed waitpid acknowledgment. First two script revisions were not contemporaneously source-hashed; successful third script was captured before/after. No missing event is backdated.

Resealed negative controls demonstrate checker trust gaps; they do not claim the original child emitted false results. Root alone owns canonical/Git/storage/credentials. No remote GET was repeated here. No sibling reviewer report was read. Requested review-adversarial/xhigh; serving model unverified/null.

Narrow next action and evidence

Repair exact closure/public-witness checking and nested native expiry/watchdog cleanup outside pinned mathematics. Reject the retained counterexamples and preserve partial records before a separately frozen/admitted scientific 48-curve cohort. This review requests no generic math round.

Primary artifacts: source-review.json, checks.json and read-attestation.yaml in reviews/TASK-20261030-e6c474. checks.json embeds complete editable Typst and graph sources, compressed raw work evidence, SHA/byte extraction manifest, source snapshots, live events, failures and control witnesses. Source archive TASK-20261030-88d0e5 and source publication48b73e0756 are inputs. Canonical scientific graphs remain unchanged because this review promotes no scientific result.
