Independent long-quiet control

TASK-20261104-58aa74 | 2026-11-05 | J-longquiet: inconclusive

Question and result

J-longquiet is inconclusive. The one permitted native fixture completed as output_validated; driver and unchanged checker both returned 0. The reviewer did not obtain the required confirmed 125-second STOP interval and full independent quiet/liveness witness. [pcc:unverified]

Observation

Fixed zero-entropy F11 (r=13) and F23 (r=17), ordinary candidate and baseline fixture_fault=hang; stage200 s, grace2 s, native outer260 s. The marker was retained in the complete sealed baseline output. Distinct candidate PID82847, baseline PID82850, observer PID82841, driver PID82839 and persistent native parent PID82836 were recorded. [pcc:unverified]

Failed condition

The reviewer added strace to preserve genuine OS wait syscalls. After SIGSTOP, /proc showed t (tracing stop), while control.py required T before starting its 125.5 s interval. That branch never started. Cleanup rechecked PID82850/start3081255/parent82839/post-exec argv, sent SIGCONT, then retained the monitor disappearance error. No tracing stop or signal-to-CONT duration is accepted as the missing witness. [pcc:unverified]

Comparison

SIGSTOP-send to cleanup-CONT was 125.500236 s; this is a measured signal-bracket only. The confirmed T-stop interval and independent complete >120 s event-free/liveness interval are absent. Native source checks passed closed bytes, source/input identity and custody; these checks cannot fill the absent independent timing witness. [pcc:unverified]

Timing and waits

The single absolute control clock began at monotonic 30691.203660922 before mirror/setup/helper authoring, ended at 30947.337384575, and spanned 256.133724 s within300 s. Native driver/checker, candidate/baseline and observer waits are retained in OS wait4 traces, native receipt and custody files; final helper waitpid returned ECHILD. No retry or second native call occurred. [pcc:unverified]

Signal bracket 125.500 s; confirmed T-stop interval absent. n=1.

Native checker passed. [pcc:unverified]

Scope, provenance and limits

Limits and provenance

Exact59 source bytes matched before and after; native internal Git metadata only used the read-only .git link. Parent RLIMIT_AS=4 GiB and child2 GiB limits were applied; full aggregate RSS coverage was not obtained because the liveness loop did not start, so no peak RSS/fit claim is made. Whole task limit900 s, newraw128 MiB, capsule32 MiB, logs16 MiB and free reserve256 MiB remain explicit. [pcc:unverified]

Source interpretation

lifecycle.os.execv explains the distinct pre-exec wrapper and post-exec baseline command. Observer quiet timeout is stage200+grace2+5=207 s. The marker precedes baseline sleep60 and does not prove entered sleep. Declared Python monotonic/sleep and Linux nanosleep/PDEATHSIG/subreaper primary references were read; copied source and all new evidence are retained losslessly in checks.json. [pcc:unverified]

Deviation and next action

The necessary immutable native-closure.json keyset dependency was absent from the card input list; the coordinator clarified this existing transitive dependency, with no change to exact59. Unplanned ptrace interference and same-attempt cleanup are preserved as deviations. Any future witness requires a separately authorized new task; this task stops after delivery. No canonical graph was changed because this is a single incomplete software witness and graph read scope excludes canonical graphs. [pcc:unverified]

Evidence retained

checks.json holds a lossless, hashed capsule of helper and cleanup source, every new raw file, full before/after source captures, command/argv/environment, OS waits, errors and editable report source. Source archive R2: 735492ce3ab48f8c8be313395d5191d78cb7a816. Source publication: af8a54211bcd6f0503c3d58d159289bff6a023ce. [pcc:unverified]

Primary references

Declared frozen Python time.monotonic/time.sleep manual, Linux nanosleep(2), and lifecycle-references.json (Python Popen, PR_SET_PDEATHSIG, PR_SET_CHILD_SUBREAPER); semantic scope recorded in read-attestation.yaml. No protected prior outcomes or helpers were read. [pcc:unverified]

Review attestation

Owner TASK-20261104-58aa74; joint J-longquiet; verdict inconclusive; sibling reports read: false; blindness respected: true. Full actual source list is in read-attestation.yaml. External plan SHA256 ea07ac6ce046681d054e63f7c7de7e4bd3ece62f15e51372bf07aa5a3269e55c. [pcc:unverified]
