EKS image preflight for the n51 D5 stream trial

Semaev quotient-lift evidence packet

1 November 2026

The pinned EKS image completed one native small-system control. Its 1,040-byte D5 candidate was streamed to the assigned S3 prefix, fully read back, and accepted by the original checker with codimension 3. A separate host download reproduced SHA-256 `7cf2d46d96fe...e82d73`. This qualifies transport and checker behavior in the image; the n51 frontier result is separate.

Attempt	Bootstrap or native result	Fixture reached?
Artifact-store source	S3 HeadObject 403	No
Public source	Output directory absent	No
Public source v2	No tar executable	No
Public source v3	Full S3 readback; checker codimension 3	Yes

Successful Job: `semaev-d5-stream-custody-preflight-public-v3-20261101`.
Job UID: `ef4cb600-5b65-4ead-ba22-38f87369270b`. Image digest ends `0e4581`; limits: 2 CPU, 2 GiB, 900 seconds, zero retries. The exact 120,902-byte public bundle has SHA-256 `3be9cffdf5fb...7bfc103`. The adjacent `preflight/` directory contains the S3 readback manifest, original checker transcript, Job receipt, transfer result, and candidate bytes. Only the fourth Job reached the native fixture. No n51 degree-six claim follows from this control.
