Formal target source pointers

Auto-researcher main `e03417c` · October 31, 2026

The 91 formal target specs declare 32 distinct source files. Each row in `links.json` binds the target, source, and Lean module to exact-tree SHA-256 hashes.

Pointer category	Targets	Interpretation
Source under an `EXP-*` directory	8	Direct experiment path
Source under a `RUN-*` directory	0	No direct run path
Source bytes mention standalone `EXP-*`	17	Six distinct tracked IDs
Source bytes mention standalone `RUN-*`	11	Five distinct IDs

The categories overlap. The two FROB run IDs without matching `RUN-*` directory names appear in manifests inside `TASK-*` directories. The prior count of eight unique experiment IDs included two strings inside amendment IDs; the standalone count is six.

Claim boundary. These are source links. They do not elaborate Lean declarations, review theorem meaning, validate measurements, or authenticate run execution. A source status of `PROVED` is metadata, not a verdict from this inventory. No proof-coverage percentage follows without a claim-level denominator.

Reproduction. `python3 tools/formal_target_source_inventory.py e03417ca2831c6000f100e55b5cb4185b0421072 docs/reports/2026-10-31-formal-target-links/links.json`
