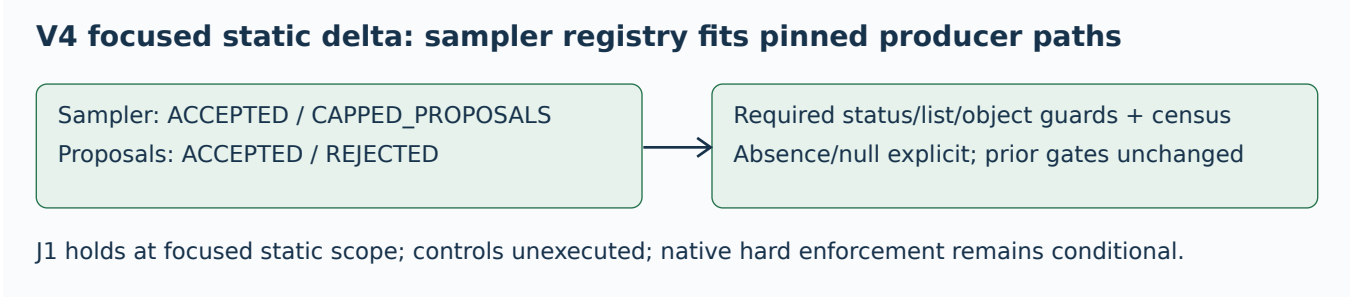
V4 focused sampler review — J1 holds

TASK-20261106-907bb5 · 2026-11-06

The V4 registry admits the pinned producer sampler/proposal statuses and rejects unknown, nontext or missing required fields. The V3 false rejection is closed on static inspection. No new material defect was found in this focused delta. This is source-fit review; controls and raw data were not executed or scanned.



Producer fit and false-object checks

Pinned engine.py:356-359 emits sampler ACCEPTED/CAPPED_PROPOSALS and proposal ACCEPTED/REJECTED. Lines434-442 embed sampling in draw.point_sampling. V4 verify54-55 and123-128 register both exact status paths; recursive list notation matches proposals.[].status. The valid ACCEPTED chain with REJECTED then ACCEPTED proposals passes these guards and is counted; the registered capped report is accepted as a schema object, without claiming normal trace emission after a sampler failure.

verify99-122 requires provided nonnull draw/sampler objects, sampler status, proposals list and every proposal object/status. require_status58-61 requires exact str plus membership. Unknown/nontext/missing status, absent/nonlist proposals, and missing/bad proposal status fail before any successful audit. Extra unregistered status paths still fail130-146.

verify94-106 records draw and point_sampling provided/null markers. Absent draw, draw=null, absent point_sampling and point_sampling=null remain distinct valid cases. No missing state is invented as a source status.

Controls and nonregression

Future checker controls150-209 include all seven enum groups, scalar-free accepted/capped sampler records, null sampling, unknown/nontext and missing-shape negatives. They are called only inside the eventual admitted checker before reference seal. None ran in this review.

Solver and driver are byte-identical to V3. Static AST comparison verifies main, require_status, is_prime, Projective, canonical_scalar and write_new unchanged. Thus prior cell/word/strict/predicate gates, F1 incomplete RECOVERED retention, F2 canonical blindings, cumulative CPU/original stop, complete contexts and source/manifest/order checks remain intact. The focused source diff changes sampler registry/shape/census and planned controls only.

Qualifications, pins and budget

J1 holds only on this focused static delta. CPU accounting remains sampled with a fixed finalization reserve; wall checks cooperative; native hard group/claim/watchdog enforcement remains an unverified external dependency. Actual source/manifest/runtime custody and empirical certificates await a properly admitted run. No experiment approval or performance/scaling claim follows. V1/V2/V3 adverse reviews remain immutable; V1 305.14s/300s UNMET and all memory qualifications remain unchanged.

Source commit supplied:fe720d01b9ded5cd8325b08afa80a4d444ccbf76. All source hashes/read accounting are in checks.json. No Git/remote query was made.

Independent of implementer; same prior reviewer, openly post hoc delta, not independent replication of own review. Primary schema source: pinned local producer engine, statically read/hash-verified by this session. Source status inventory was searched; uniform draw metadata has no status. No sibling review or raw payload read; no source import or scientific/control/fixture/unit execution.

New claim acquired17:28:14Z (1793986094); fixed stop17:33:14Z (1793986394). Whole review300s including report/render/view; no extension/reset. Memory4GiB compliance unverified. Actual final timing and render/inspection logs are in checks.json/report.md. Canonical scientific graphs remain unchanged and outside scope.
