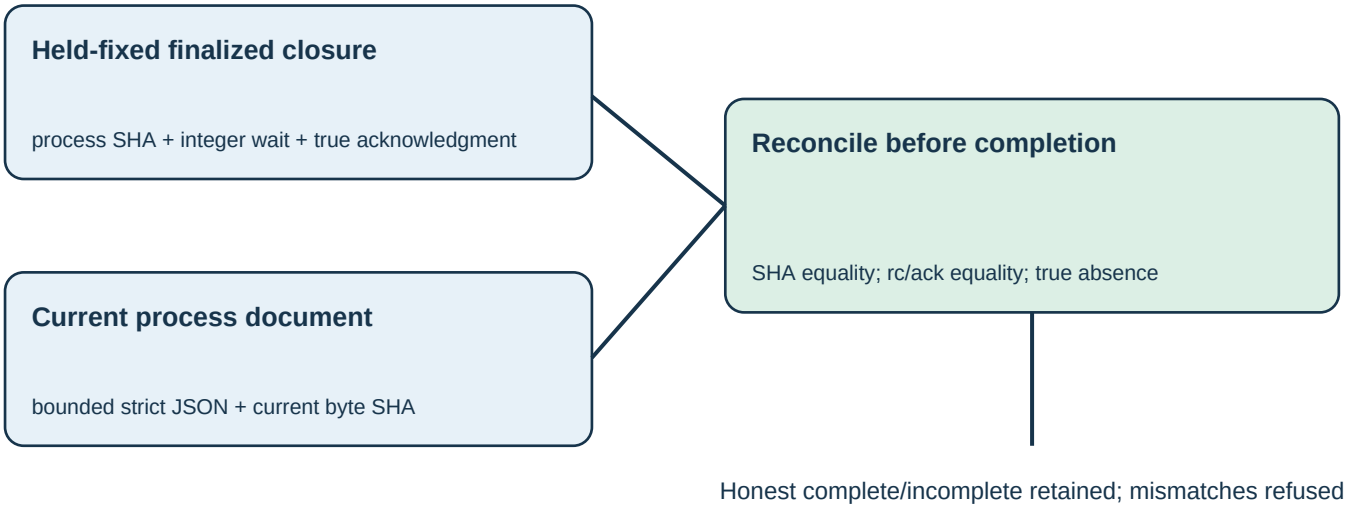
Finalized closure reconciliation

TASK-20261104-fb3825 | BATCH-27c9d5 | 2026-11-04 | software controls only

A narrow loader repair compares current process bytes and typed wait facts with finalized root custody before downstream completion is derived.

Only observer.py and its manifest entry change. [pcc:unverified]



Recorded positive controls [pcc:unverified]

P-complete	output_validated	2 solver closures
P-incomplete	infrastructure_error	honest static incomplete; waits1/1
P-generator	output_validated	3 closures; 2 solver export rows

Original attack: genuine same-public raw, forged waits0 and completiontrue.

Held-fixed root custody caused a finalized process-SHA refusal for baseline.

The original native receipt remained infrastructure_error. [pcc:unverified]

No scientific draw, fresh nonce, EXP/IDEA, VM or benchmark occurred.

The diagram shows custody checks, not a mathematical or performance result.

The fixed generator fixture does not establish production generation-state flow.

Controls, preservation and limits

Same final source across all control attempts | [pcc:unverified]

3 per-arm attacks

Candidate, baseline and generator reseals each refused at their closure SHA.

11 structure controls

Missing/false ack and absence; bool/string/wrong rc; missing SHA/current ack.

Original reseal

Both genuine failed solver outputs replaced by valid same-public raw; refused.

Helper assertion

Expected candidate first; sorted baseline correctly refused first. Retained.

Capture collision

Continuation stopped before a native call on an exclusive filename. Retained.

No hidden retry

Only remaining controls continued; exactly3 native fixture invocations.

Timing limitation

93.8s logged execution;198.7s including repair gaps exceeds continuous180s.

Exact reconstruction

Reversed known process mutations match held-fixed original process SHAs.

Source scope

Other57 capture members, native/check argv, math and schemas unchanged.

Evidence

Full logs, helper/editable sources, before/after and partials in observations.json.

Trust boundary

Source-pinned local supervisor/root custody assumed; no whole-boundary auth.

PCC standing

Producer assertions only; root registers unsigned claims; no worker signing.

Next step

Root publication, PCC registration and fresh independent technical review.

Review-plan SHA: ff31ba0533af0a55ba09d84c01dde6da9c58a34a15e236a4d6539d35f146d6e5
