Independent derivation and publication update

2026-10-24. TASK-20261024-da3810; archive TASK-20261024-6c911a. This is a scoped mathematical/software audit, not an ECDLP experiment.

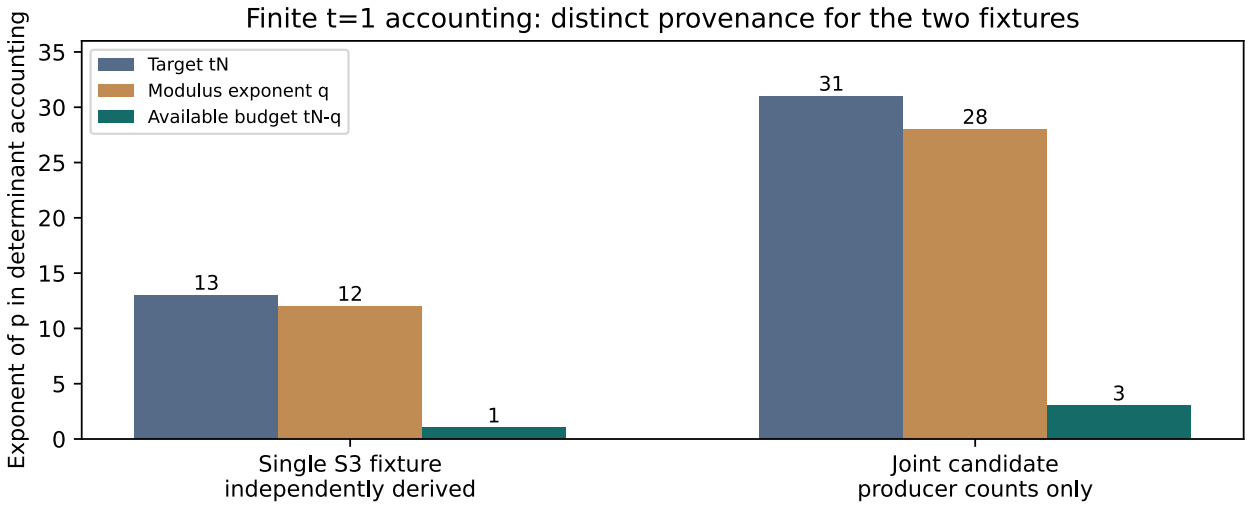
Independent result

The blind reviewer derives K = t N - q, with LLL and evaluation-norm losses explicitly separated. The full-box limiting equal-beta determinant statistic is 2 divided by n d (n+1). Independently expanded S3 and exact Bareiss elimination reproduce the determinant 101 to the power 12 times 2 to the power 33 on the assigned 13-column fixture.

The reviewer read four committed input/role files, plus disclosed environment guidance and metadata. No producer code, result, tests or sibling report was read. The report discloses its runtime-path deviation and absent model probe. It returns inconclusive on compatibility with the unseen implementation.

Parent comparison and provenance

For the matching fixture N=13, q=12 and t=1. The historical RHS is 12; the independently derived available budget is 1, which the successor reports. This is a finite arithmetic/software comparison, not an optimized joint reach bound or a working decomposition oracle.



Exact recorded counts, one deterministic fixture per group. The joint candidate counts are producer artifacts, not independently reviewed measurements.

Publication and remaining work

PR 2547 publishes the prepared branch after the user's explicit authorization. CI remains queued. Auto-merge was separately refused as outside publication authorization; the PR remains open. No alternative merge route was attempted.

The original report and raw artifacts are preserved. The 23 passing software tests and exact same-source replay are separate from this blind derivation. No scientific state, hypothesis or leaderboard status is changed. Optimized shifts, weighted-bound normalization, higher-rank GAPs, verified root extraction, random-target relation rank/yield and matched full IC measurements remain open. No verified IC improvement is established.
