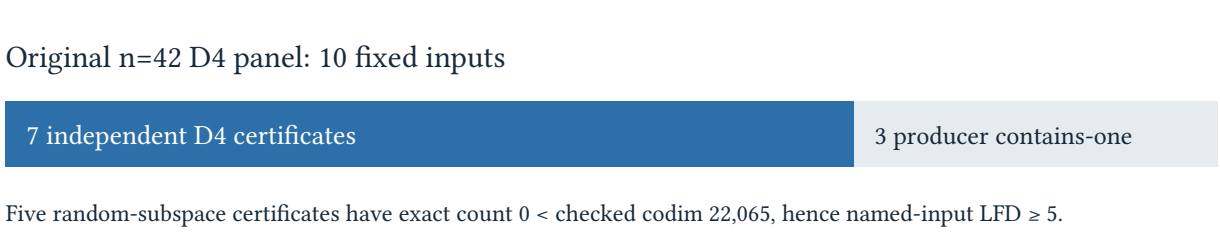
Recovered n=42 degree-four certificates

Two interrupted original-panel attempts, `fresh-n42-rand-03` and `fresh-n42-rand-04`, retained complete 329 MB D4 certificate candidates but lacked terminal results. The closure producer was not rerun. The original independent checker accepted both certificates with codimension at least 22,065; a fresh pinned exhaustive counter found zero solutions for each. Thus each exact named Boolean presentation has last fall degree at least 5. The original producer exit codes remain unknown.

Input	Fresh count	Checked D4 codim ≥	LFD ≥
`rand-03`	0	22,065	5
`rand-04`	0	22,065	5



The original n=42 D4 panel now has 10/10 terminal attempts: seven accepted certificates and three producer contains-one outputs. Five certificates have the strict count gap needed for LFD ≥ 5. The two recovered certificate files, receipts, evidence archives and publication acknowledgements are in the public release `semaev-closure-certificates-20261029`. Every asset passed anonymous HTTPS and canonical S3 download/hash readback. Small raw transcripts and results are bound by `runs/n42-retained-recovery-001/manifest.json`; certificate binaries are in the release.
