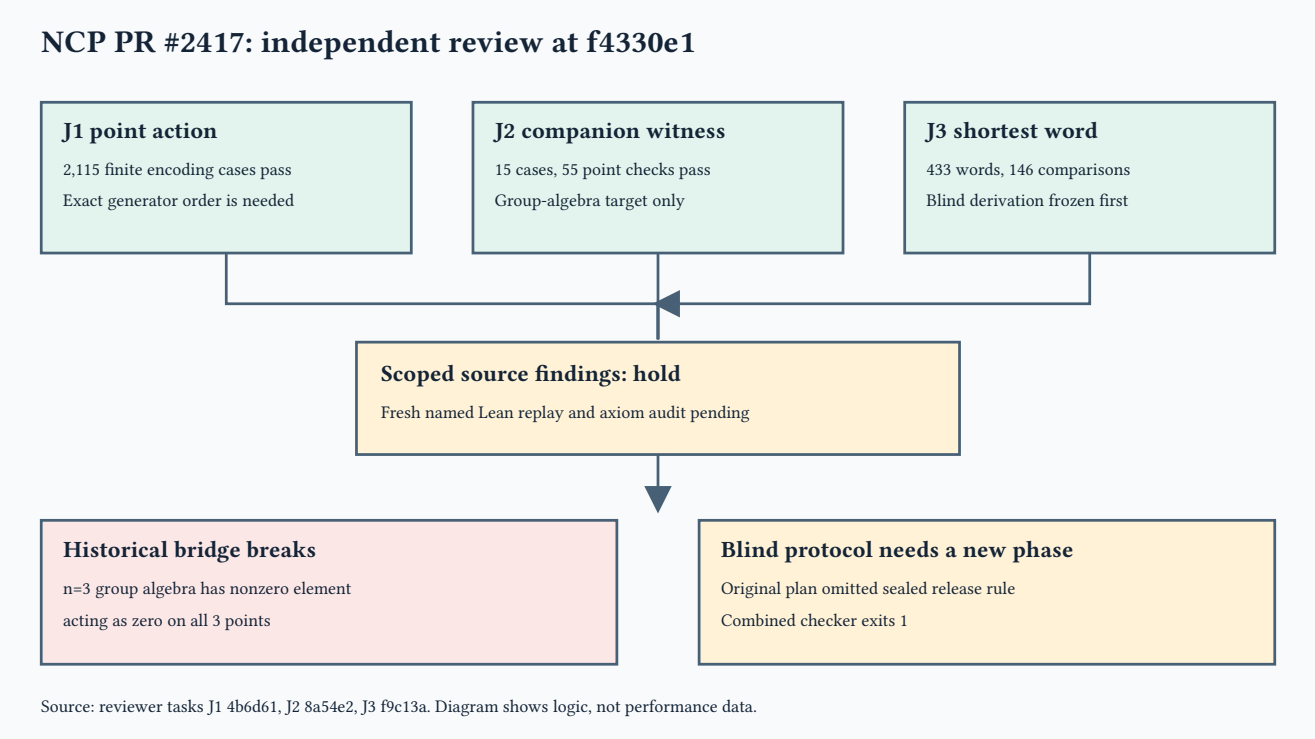
Independent NCP review synthesis

Archive: TASK-20261031-20ed91
Producer: PR 2417, exact head `f4330e1a29feb8fdea9f1eab7131ae5cde2e2b6f`
Plan SHA-256: `f5d4d26008bc3cf0ffe3fd26c7a36dbd93a57499c4aff6dc4e61a65a3bf13264`

The scoped source calculations survived independent review. J1 checked 2,115 finite point-encoding cases. J2 checked the companion witness in 15 modulus/translation cases and 55 point evaluations. J3 independently derived the shortest-word formula before reading producer code and checked 433 words and 146 state/sign comparisons. These controls are mathematical and source-level evidence, not fresh Lean elaboration.

Joint	Scoped finding	Formal status
J1	Point action and canonical encoding match source; exact order is necessary.	Source fidelity faithful_scoped; machine not_verified; outcome inconclusive.
J2	Squared negation-translation witness maps to zero in affine group algebra; augmentation is −1.	Source fidelity faithful_scoped; fresh replay infrastructure_error; outcome inconclusive.
J3	Minimum length is sum of absolute counts plus penalty 0, 1, or 2 by sign and negative-coordinate condition.	Independent derivation holds; machine not_verified; outcome inconclusive.



Source: reviewer tasks J1 4b6d61, J2 8a54e2, J3 f9c13a. Diagram shows logic, not performance data.

Separate historical bridge finding

At modulus 3, a nonzero group-algebra combination of three translations and three translated reflections acts as the zero 3-by-3 point-operator matrix. Faithfulness of the affine group action does not make its group-algebra representation faithful. J2 supplies the exact coefficients and a concrete three-point elliptic-curve realization over F5. The submitted companion theorem targets the group algebra, so this does not refute it. The historical embedding sentence needs a new producer revision.

Independence and next gate

All 118 copied reviewer files match their three published source commits by Git blob, with no missing or extra file. J3's blind derivation was frozen at `8b53f4c94b2b06f6cfdebfcd89b3ed2fd6ef6d9d` before any producer read. The original plan omitted a prospective sealed release rule; the complete-session attestation includes four later protected reads. The exact combined independence checker exits 1 with that single issue. No clean independence pass is claimed.

The next machine step is an owned, isolated exact-pin Lean build of each named declaration, elaborated type capture, transitive axiom audit, and full input hashes. Then correct the historical target-identification sentence and re-review the affected claim. A new blind round needs a prospective phased-release plan. This technical packet makes no official scientific transition.

Evidence: review.md in each of TASK-20261031-4b6d61, TASK-20261031-8a54e2, and TASK-20261031-f9c13a. Raw controls, attestations, and inspected reviewer PDFs are archived with those reports. Diagram is a logic map; no performance data were changed.
