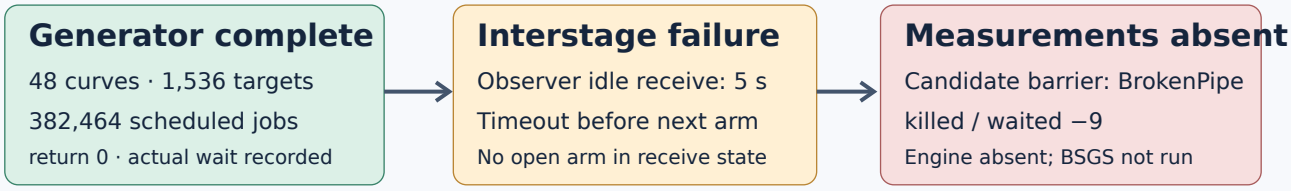
Full48 generation completed

Paired solver measurements absent

EXP-ECDLP-356403 · RUN-ECDLP-0ade3c · 5 November 2026

The single physical attempt ended in native infrastructure_error: driver 1, checker absent, outer wait returned 3. The generator completed 48 curves and1,536 targets. Candidate observation hit BrokenPipe before engine output; the candidate was killed and actually waited at −9. No baseline process measurement exists. Missing solver data is not zero recovery.

One physical attempt; paired solver measurements absent



RUN-ECDLP-0ade3c · native infrastructure_error · driver 1 · checker absent

Outer observed elapsed 239.009645 s; wall_valid=false (unqualified operational timing)

Diagram of recorded pipeline: no two comparable solver values exist. Scheduled jobs are not completed candidate jobs.

Recorded quantity	Value and scope
Native attempts / validated / infrastructure failed	1 / 0 / 1
Generator public entries	48 curves; 1,536 targets; 382,464 scheduled jobs
Outer elapsed	239.009645033 seconds; wall_valid=false
Benchmark command wall	238.921 seconds; separate scope; INVALID
Logical raw inventory	31 files; 324,636,014 bytes
Candidate engine / BSGS measurements	Absent / not executed
CPU time, counters, qualified solver time	Not recorded or not qualified

The observer trace records TimeoutError after the generator closed. The original receive loop selected 5 seconds when no arm was outstanding while adapter postprocessing continued. The subsequent candidate barrier failed. This is an operational record; no attack-cost or asymptotic conclusion follows.

Frozen execution and custody

Source: af8a54211bcd6f0503c3d58d159289bff6a023ce Launch context: 10b03d5572ab8894c323d7ca5f0cd409981da5e7 (recorded clean) Native RUN: RUN-ECDLP-0ade3c; task: TASK-20261105-6c94f6 Hypothesis: H-ECDLP-6674c9; goal: GOAL-ECDLP-e70832

The exact native command is retained in command.txt and the report Markdown; the outer command ran tools/experiment_execution.py run –plan experiments/EXP-ECDLP-356403/trial-plan.json with the original owner and epoch 1. The original source/config/plan and public nonce/exclusion list remain preserved. Stage 3600s/grace 2, child 6 GiB/native 12 GiB and declared 4 CPU were resource caps, not predictions of completion. Host CPU: Intel Xeon Platinum 8573C ; 5 online CPUs recorded. CPU time is unavailable.

Original schedule (planned, not completed candidate work): 216 setups; 345,600 singles; 36,864 intents and traces; 73,728 cells; 8 calibration arms; all 6 confirmation cells; 64 targets×8 blindings per confirmation curve; 1,536 working-BSGS solves. The generator output is separately paid. Existing fixed software controls were inherited; no new A/A, planted or null physical arm ran. No paired export or final checker result exists.

The 31 raw payload identities and receipt were published first in a66d1035b7fa9b8a4b1678e7efaef8dcfde9bed3. Large payloads have committed identity pointers and root full-GET receipts. The original sidecar remains byte-exact. PCC-20261105-9149bd is unverified.

Two INVALID benchmark records refer to this SAME physical attempt. The 0212Z record additively corrects the 0155Z raw inventory and explicitly records measurement_reexecuted=false and physical_attempt_count_across_both_records=1. It is not a second attempt.

Public cohort SHA: 76c329506086cd8572534b49080f33b7c0725e3245215c0236b503faa2a4b0bc Canonical job-plan SHA: 91a1730463e6cd8bec8453d6417a384709b240949085a04d0e941612defd5a3a

A prospective recovery must keep this public cohort and charge each actual regeneration. Nothing here authorizes a retry or changes source acceptance, mathematical status or the hypothesis. Later interstage control work is separate from these first-attempt observations.
