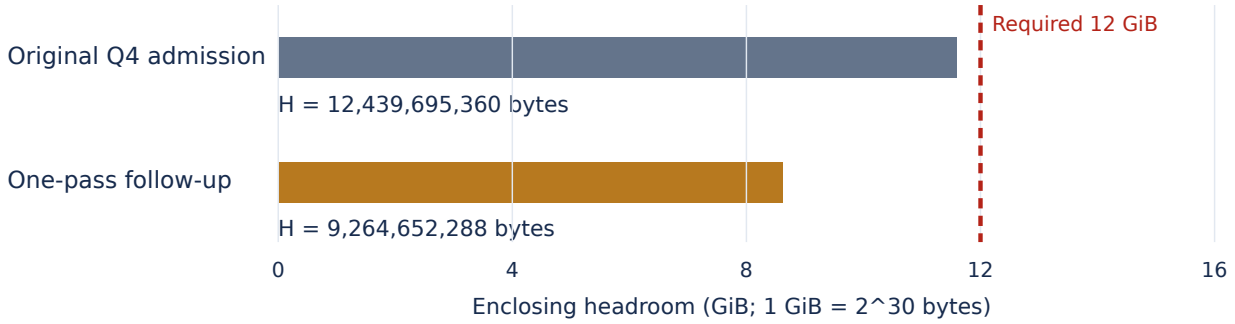
Guard qualification remains partial

TASK-20261026-94c1e6 · DEC-20261026-3380c9 · 27 October 2026

Decision: revise. Independent full-joint verdict: breaks. Both Q4 admissions stopped before an allocator ran. Narrower placement, tree cleanup, repaired watchdog/serial exclusion, Q5 negatives and declared native custody hold in the recorded fixture. Actual OOM behavior is untested, not falsified. Full guard qualification remains false; no scientific approval or IC-improvement claim follows. Root must verify and publish the isolated ledger archive before this decision is official.

Actual OOM enforcement remains untested

One conservative H summary per admission; no uncertainty reported



Both admissions: infrastructure_not_started; no OOM allocator ran

Follow-up deficit: 3,620,249,600 bytes. Exact 8 GiB empty-cap readback is not OOM evidence.

The preparation pass and host observations do not isolate a causal effect on headroom.

Sources: TASK-20261026-6374dd/Q4; TASK-20261026-1525ac/post-advice-headroom-1.

Worker cap excluded from H; effective zero swap observed through parent; hidden ancestors unobserved.

Observation: original and successor rows remain separate

Record	Retained observation and attribution
Original Q1 / Q2 / Q5	Placement, exact cap readback, escaped-session cleanup and two Q5 negatives passed in C1. No rerun under repaired helper.
Original Q3	Failed dedicated competitor receipt: ECHILD, status/usage unavailable. Real watchdog, rejection, cleanup and lock release retained.
Q3 follow-up	Passed once with repaired receipt order. Production 1,800,064,885,794 ns; independent 1,800,065,709,473 ns; censoring true, wait status 9.
Both Q4 records	Infrastructure not started; zero allocator and Q4 worker launches. Empty 8 GiB readback supplies no OOM enforcement evidence.

Q3′s dedicated wait4 retained exact PID 7, errno 0, reaped true, exit 0 and actual usage 1,018 us user / 0 us system. Serial rejection preceded a competing worker launch; none ran. Stable escaped descendants changed R/Z with populated 1 to Z/Z with populated 0; group removal, lock reacquisition and container absence were retained. The external 1,950-second fail-safe did not fire. These are software observations, not speed comparisons.

Comparison: the required enforcement test never ran

Original H is 12,439,695,360 bytes; derived shortfall is 445,206,528 bytes. Follow-up H is 9,264,652,288; derived shortfall is 3,620,249,600. Each is a conservative recorded minimum, excluding the prospective 8 GiB worker. Uncertainty was not reported; hidden ancestors remain unobserved. The chart does not estimate a causal preparation effect.

The sole advice pass accepted 375 unique eligible files / 631,361,269 bytes with all returns 0 and stable metadata; 23 duplicate-inode aliases were excluded from 398 candidates. Advice is not reclamation proof. Raw child swap max was max, with effective zero swap observed through parent cap 0. Neither Q4 has an OOM event delta, victim, peak at enforcement, parent-survival or post-OOM cleanup receipt.

Independent review, custody and remaining gates

Source binding and narrow transfer

Original C1 is 204735c3f6f3144911df58a6ece7699c0e74d4ad. Final owner source is 76a3e4eb67e818354da7575dad4b834467a97e5c; programme snapshot is c90b8b1a12bc6323ece604a965bb96bad823c166. All 12 protected production files remain identical to pin 86ddd19f67. The sole helper diff moves Q3′s dedicated receipt before generic cleanup, after supervised() returns. Worker, runtime, other branches, predicates, envelope and 1800-second timer are unchanged. The Reviewer supports Q1/Q2/Q5 as evidence about that same supervisor and fixture, without rescoring original Q3 or implying all five classes reran.

The Reviewer verified original 691-path and successor 690-path sets with zero delta, all 681 current successor member hashes/bytes, seven shards, five retained external binaries and both five-output snapshots. Original subtree indexes declare hashes but no byte counts. Historical phase manifests resolve at their own commit trees; the final index binds the appended log. Guard custody is complete for those declared sets, distinct from the incomplete full Rust log below.

Pre-action source/admission publication gates hold in their actual order. Preparation archive 608f7198 was published at 01:10:40Z, after Q3 started at 01:03:08.619938647Z. It preserves completed preparation records and is not represented as a prelaunch source/admission gate. This explicit timing supplies no Q4 coverage.

Actual independent checker and review limits

The canonical explicit-plan checker exits 0: “1 report(s), every joint owned and attested, blindness respected, controls declared.” TASK-20261026-5bedd5 is one fresh fork:none review: openai/gpt-5.6-sol, review-adversarial, xhigh, no fallback or degradation. Its verdict breaks the full guard-enforcement-coverage-and-retention joint because OOM is absent; narrower observations hold. Reviewer guard, regression, stress and scientific execution counts are all 0. The one producer retention regression passed; no reviewer replay is claimed. Mechanical consistency is not private runtime authentication.

Positive fixtures use trusted root workers in the recorded privileged private-cgroup container, pinned Debian image, network none, read-only rootfs/build/library binds, 16 GiB parent memory and memory-plus-swap request, 2 CPUs and pids 64. Q5-readonly is separately nonprivileged. Full process-tree CPU and hidden ancestors remain unknown. The production preflight checks host MemAvailable; stronger enclosing-headroom admission is fixture-side. No general low-headroom production refusal or hostile-worker guarantee follows.

Older mathematical review retains its two attestation/phase-list checker issues and unresolved applicability. CPU-only DEC-20261026-49e865 remains separate. Current Rust full run is exit 101: 4,888 passed, 6 failed, 121 ignored; six same-binary replays are 4 failed / 2 passed. The 18-file package is excerpt/replays. The 431,104-byte full log remains local after configured-credential upload failure; canonical full-log custody is incomplete. Owner 76a3 has 16 failed checks and one skip; inspected review job 121956938857 did not start because of account billing/spending-limit availability. No check bypass or clean Rust claim follows.

Retained diagnostics: eight raw-log blank-at-EOF findings leave cached diff check exit 2; reviewer metadata transport recovery and wrong-checkout blocked promisor-fetch attempt remain recorded, with no object retrieved or case rerun. Missing agents/reviewer.md led the Reviewer to apply the present shared review contracts. No new external literature retrieval was permitted for the Reviewer. Coordinator read repository contracts, prior reviews and retained primary waitpid/waitid documentation; no new mathematical or novelty claim is made.

Exactly one next action

Coordinator: after verified ledger publication, retain the active goal’s resource impediment and prospectively specify lawful actual OOM qualification with measured enclosing H at least 12,884,901,888 bytes, unchanged 8 GiB payload/production watchdog, serial admission, event/victim/peak/parent-survival/cleanup receipts and fresh maintained ownership. Recheck when that host/admission packet exists. Current one-pass/no-retry cards authorize no more advice, allocator or case.

All 24 scientific cases remain unrun. Joint reach-cost, theorem applicability, executed parity, extraction, fully charged matched IC cost and verified IC improvement remain unresolved. Goal stays active. Knowledge promotion: none. Canonical reach-cost, accounting and weighted-reach graphs were checked and left unchanged; this report changes no supported scientific relationship.

Evidence: TASK6374dd original packet; TASK1525ac successor packet and TASKb7eff7 snapshot; TASK5bedd5 report/attestation/checks; independence-check.json and report.md hold exact paths/digests. Coordinator claim94c1e6 epoch1; coordinator-orchestration-code, parent-managed openai-gpt61/gpt-6.1-sol/high. No new API probe, scientific call, usage estimate or delegated agent. Root owns isolated ten-file ledger archive, publication and PR controls.
