Fresh Q4 qualification remains partial

DEC-20261029-7ce9bf · TASK-20261029-947247 · 2026-10-29

Decision: revise / partial / unqualified. Required OOM coverage is absent. The canonical independence check fails on the frozen Coordinator plan. No qualification, round completion, mathematical negative or scientific promotion is accepted.

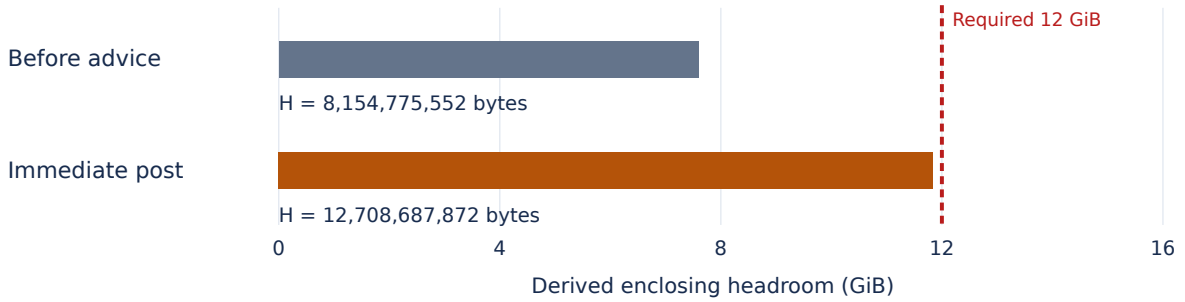

Observation

TASK-20261029-30f612 performed one native source-only seal: 80 accepted, zero exclusions, 4,557,159,684 bytes. Published prep66ea / snapshot86f4 precedes advice. The source-only mapping correctione946 preserves production and prep bytes. The corrected Q4 launcher was syntax-checked and never executed.

Under separate advice-only327869 authority, TASK-20261029-6f4f28 performed one native –advise: exit0, 80 accepted, zero failures/exclusions, every raw row rc=0 and stable_after=1. Capacity is not reclaimed-byte proof.

One advice pass; Q4 refused before launch

TASK-20261029-6f4f28 · one snapshot per phase · no uncertainty interval reported

Post shortfall = 12,884,901,888 − 12,708,687,872 = 176,214,016 bytes

80 accepted files / 4,557,159,684 bytes of capacity ≠ measured reclaimed bytes.
Q4 containers, drivers, workers, allocators and scientific calls: all zero. No retry.

Derived H from raw owner0bcdc1a8 advice-control/pre-resources.json and post-resources.json. One sequential snapshot per phase; uncertainty/error bars unreported. 1GiB=2^30 bytes. Zero Q4 runs. Editable graph data are embedded in diagram.svg and repeated in report.md.

H = min(host MemAvailable, every finite visible enclosing max − current). Post H = min(17,974,874,112, 17,179,869,184 − 4,471,181,312) = 12,708,687,872 bytes. Required12,884,901,888 minus postH = **176,214,016 bytes**.

Post capture16:48:19.806546–16:48:19.807241Z came first after helper return, before advised-file/ library/Git rereading; marker follows16:48:19.807465Z. No exact causal reclamation quantity is inferred. Refusal a204291 is terminal: no further advice or case, even if later resources change.

Comparison and interpretation

What exists, and what does not

Fresh Reviewer TASK-20261029-e276d7 independently recomputed H and checked96prep paths plus26case-inventory paths (25members+self;24changed). Source/advice/refusal facts are coherent within their recorded scope. The owned-joint verdict is **breaks for missing required coverage**. Q4 container, driver, worker, allocator and scientific counts are all0.

Worker cap/swap/allocation/PID/starttime, OOM event delta, victim, peak, parent survival and cleanup are absent. A visible16GiB outer limit is not a measured Q4 container-parent limit. No cap failure was tested. No new all-five transfer follows. Original Q3 remains failed; earlier Q1/Q2/Q5 and repaired-Q3 retain historical trusted-worker scope. CPU17/17 DEC49e865 is separate; full process-tree CPU remains unknown.

Canonical review check: failed and preserved

The unchanged checker against original review-plan.json and frozen review-attestation.yaml returned **exit1**: blindness.lifted_for must be a list of valid TASK owners. The Coordinator plan lists two DEC IDs; the attestation joints_owned is correct. Plan, checker, reviewer bytes and actual output are retained in independence-check.json. There is no retrospective plan fix or waiver. The round is not mechanically complete and qualification remains unaccepted.

Material caveats

- Namespace0::/ with inherited mountroot/.. is mapped by stable observerPID28738/ starttime890876 membership in init, absent parentroot, before/after. Capture walks only init→visible-parent; hidden ancestors unknown. No remount or lexical traversal.
- Both visible swap.max values are max; hostSwapTotal0 does not prove an absent worker’s effective swap0. Outer oom_kill delta0 and historical peaks are not worker enforcement evidence.
- Pack-fa66 oldmtime1793053277390270427 differs from fresh1793056768668436294; cause unknown.79/80 fully match historical metadata. All80 fresh hashes/metadata/seal/advice rows agree. Old labels and records stay unchanged.
- Reviewer first wrote four outputs at wrong cwd, then moved exact bytes to approved paths. No separate outer Python interpreter launch-argv receipt exists; native helper argv/cwd/output/exit do. Safe lease snapshots are not continuous private heartbeat replay.
- C1 static defaulted event keys and substring membership require actual raw-key/exact-PID checks in a future accepted case. No runtime rerun occurred.

Scientific scope

No new KN scientific finding. Goal active, checkpoint and other lanes unchanged. All24scientific cells remain0run. Joint reach–cost, applicable optimized joint theorem/construction, native/reference parity, root extraction, yield/rank and matched complete prime-field IC improvement remain unresolved. Earlier mathematical independence/quorum issues remain unchanged.

Custody, next action and graph disposition

Exact existing chain

Source prep66ea1a69 / programme86f4e6b8 / verificationadb30907; correctione9467d35; advice32786901; refusal a204291f; normal merge8217b448 then owner raw0bcdc1a8f950715e6539780702706b8985071e5f. Owner manifest SHA13a48120… binds26inventory/24changed. Programme result snapshotcc367e96706d69abe3535710dbe3bcb0f438b1f2 has parent35cac886… and exact producer4+receipt. Reviewer4 and this composition enter existing947ledger archive after actual root verification. No future commit is invented.

Original production86ddd19f and C1driver/worker remain unchanged. The sourcev2 launcher SHAe258c8bb… and seal80e18f24… remain unexecuted. Journal deferral was resolved by normal union preserving parent blocks, then final raw append. Own raw24path diffcheck0/artifactPASS are scoped. Full merged cached check128 with3inherited trailing warnings and promisor503 remains non-PASS.

Ancillary validation snapshot

Frozen reviewer pending snapshots remain unchanged. New root17:53 input: current8217 Rust/Cargo/tests equal raw0bcdc; **5261 passed,0failed,123ignored,0filtered of5384; exit0 in1427.58s**. This is current-library PASS, not Q4 qualification. Fullraw467436B SHA625799c4… stays localonly/canonical uploadfalse. No upload attempted or access denial claimed; exactmetadata embedded in independence-check.json. Missing tracked pencil package was restored without source/test/workload change. Historical12c full5198passed/8failed/123ignored plus8individual replay passes remains a failed full run. Full raw464884Bcanonical custody is incomplete. Older4888/6/121 and431104Braw custody gap remain historical. These are not guard/scientific metrics.

Canonical graphs checked and unchanged

The LEAD-ICP-coppersmith-smallroot-semaev source-attributed single-S3 atlas, KR-IC-401ebf and superseded KR-IC-5931ee known-results inputs, and historical guard/cost diagrams were checked. Exact paths/hashes are in report.md and independence-check.json. No mathematical relationship, reach bound, curve identity, IC-cost point or mechanism changed. The per-block disposition does not close joint three-equation/six-unknown lattices. Old dated diagrams remain immutable.

Next discriminating work

1. Publish/verify the exact existing947partial archive. Retain failed independence gate and unqualified OOM status; no operational restart.
2. Current unit job is terminal. After this archive, rank metadata-only observation of first-use current test-binary/object artifacts. They may be fresh owned immutable candidates distinct from exhausted80; check actual paths/ownership/stability/capacity and observed H. No new card, seal, advice or case is authorized here. Larger host is a candidate, not asserted the only route.
3. Any fresh route needs complete prospective authority, schema-valid review plan, new ownership/source/admission and unchanged12GiB threshold,8/16GiB/effective swap0,1800/1950s timers and enforcement evidence. Original scientific applicability/readiness/extraction/full-cost obligations remain separate.
